Note-The first column in the above summary wives observations made during the month. The second colamn gives the averages lased on ohservations made from 18s! to 1983 except that hamidity reoords are
 rxiromes ohsonved from $188: 9$ th 198.8.

## REMARKS

The weather during January was pleasant, with less rain and snow than usual and with more sunshine than normal. The mean temperature for the month was 24.9 degrees which is .7 degrees higher than normal. The lowest was -4 degrees on the 27 th. The average low temperature for January is -7.1 degrees, and the extreme was -26 degrees in $190-4$. The domestic heating load for the month was 1245 degree-days, the normal for January being 1265 degreedays. The total heating load for the season is 3541 degree-days, the normal being 3814 for this period. Only 4.75 inches of snow fell in January, while the normal is 13.24 inches. The total precipitation for the month was 2.21 inches compared to a normal of 3.61 inches. There were 189 hours of bright sunshine, with 17 days classifiect as "clear". The normal hours of sunshine for January is 1.37 hours. A wind velocity of 44 miles per hour occurred on the 22 nd and there was thunder and lightning on that afternoon.

Notr: The weather observatory completed 50 years of records wit! the December 1938 bulletin. A new set of normals has been calculated based on records from 1889 to 1938 inclusive.

Two errors were made in the December bulletin. The relative humidity on December 1 should read 52 percent making the mean monthly humidity 73.3 percent, and the maximum barometer for December was 30.67 inches on the 16 th.

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1938.

## R.EMARKS

The weather during February was warmer than usual, with many rainy days. The walks and roads were either slushy or icy throughout most of the month. The mean temperature for the month was 27.8 degrees, the normal being 23.7 degrees. On the 20th the temperature reached 62 degrees, a temperature exceeded only twice in Fiebruary during the last 50 years. The lowest temperature was zero on the 17th. The heating load during the month was $10+2$ degree-days, compared to a normal of 1156 degree-days. The total heating load for the season up to February 28 is 4583 degree-days, while the normal for this period is 4970 degree-days. The total precipitation for the month was 3.62 inches, compared to a normal of 3.19 inches. Only 6 inches of snow fell, the average snowfall for February being 14 inches. The total snowfall for the winter up to the present time is 27.25 inches, compared to a normal of 38.35 inches for this period. The total wind movement during the month was 4097 miles, the normal being 4776. High winds reaching 48 miles per hour were recorded on the 4 th and 16th. There were 173 hours of bright sunshine, the normal being 158 hours.

The third column gives extremes observed from 1889 to 1938

## REMARKS

The weather during March was cold and wintry with snow on the ground throughout most of the month. The mean temperature for the month was 30.9 degrees, the normal for March being 34.4 degrees. It is interesting to note that the mean temperature for February of this year was 27.8 degrees while the mean temperature during March is normally 10.7 degrees higher than in February. The domestic heating load for March was 1057 degree-days while the normal for March is 949 degree-days. The total heating load for the winter to the end of March is 5640 degree-days, the normal for this period being 5919 degree-days.

A total of 20 inches of snow fell during the month. The storm on the 11th, 12 th, and 13 th was generally recognized as the heaviest snowfall in March since the great storm of 1888. Twelve inches of snow fell during the days mentioned and this was preceded with 6 inches on the 9th. The total precipitation during the month was 4.49 inches, the normal being 3.70 inches. There were 217 hours of bright sunshine which is well above the average of 199 hours. A high wind velocity of 48 miles per hour was recorded on the 7 th.

The third column gives extremes observed from 1889 to 19.38

## REMARKS

The weather during April was wet, cold, and disagreeable. The total precipitation for the month was 4.56 inches, the normal being 3.35 inches. Two inches of snow fell during the month, all on April 2. The total precipitation since January 1 is now 14.88 inches. The normal for this period is 13.85 inches.

The mean temperature for the month was 42.5 degrees. This is the coldest April since 1926, when the mean was +1.2 degrees. The mean temperatures for April 1898, 1907, and 1917 were also lower than that of the past month. The domestic heating load was 675 degree-days during April, compared to a normal of 579 degree-days. The total heating load for the season is 6315 degree-days: the normal for this period is 6498 degree-days. The total snowfall during the past winter was 49.25 inches, the normal being 47.73 inches. It is interesting to note that 23.5 inches fell during the two storms of November 24-25 and March 11-13.

There were 189 hours of bright sunshine, compared to a normal of 220 hours.

Dr. J. K. Shaw gives the following report on vegetation: "In contrast to the very early season of 1938 , the present spring will be recorded as very late. Vegetation is about a month behind that of last year and nearly two weeks later than average. However, a few very warm days would enable vegetation to catch up: the late spring will have little if any effect on the maturity of most fruit crops. A late spring is on the whole favorable, for it shortens the probable period of danger from spring frosts.
"Prospects for a peach crop are good as there was no cold severe enough to kill the fruit buds. We have observed considerable injury to apple wood, probably caused by the unseasonable cold of the last week in November before the wood had completely matured. The temperature of $-t^{\circ}$ on November 26, 1938 is $71 / 2$ degrees lower than any previously recorded for this month at this station, and no lower temperature was recorded during the winter. It will not be surprising if this most unusual cold caused some injury to fruit plants."

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1938.

## REMARKS

The weather during May was warm and dry. The mean temperature for the month was 59.7 degrees compared to a normal of 57.1 degrees. This is the highest mean temperature for May since 1922 with the exception of 1933 when it was 60.5 degrees. The highest temperature was 89 degrees which occurred on three davs: the 7 th, 28 th, and 31 st. The lowest temperature during the month was 32 degrees on the 14 th and 16 th. The total heating load for the month of May was 166 degree-days, making the heating load for the season 6481 degree-days, the normal being 6743 degree-days for this period.

The total rainfall for the month was 2.15 inches; the normal, 3.60 inches. In 1931, 7.44 inches fell in May and in 1903, 48 inch. There was a heavy thunderstorm with high wind on the 28 th, 1.40 inches being recorded. The total precipitation since the first of the sear is now 17.03 inches, compared to a normal of 17.45 inches for this period. Four days of rain were recorded during the month, which is the least number of rainy days on record for May since 1889. Only one day of rain, the $9 t$ h, was recorded from April 29 to May 20.

There were 284 hours of bright sunshine compared to a normal of 252 hours for May. The mean humidity for the month was nearly normal. The last frost oecurred on May 16, the normal date being May 12.
1)r. J. K. Shaw of the Pomology Department makes the following report on vegetation: "Vegetation made rapid progress during May and apple trees were in full bloom on about May 18-22, approximately one week later than normal. Slight frost did some injury to early blooming strawberries and tender plants, but the amount of injury was insignificant. Some winter injury has been noted on nursery-grown apple trees of tender varieties, probably from the unusual cold of late November. Raspherry canes were barlly killed, probably from the same cause. This will, in many plantations, severely reduce the crop.
"The weather during the blooming period of tree fruits was favorable. McIntosh apple trees bloomed heavily and should have a good crop. Other varieties were variable.
"Most of the month was rather dry but heavy showers toward the end of the month renewed the water supply and trees will have water enough to meet their needs for some time."

The second colmm gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third colunn gives extremes observed from 1889 to 19,38.

## REMIARKS

The weather during June was very nearly normal in most respects. The month generally was considered dry, but apparently there were a number of local showers which gave more rain at the weather observatory than at nearby points. The total rainfall for the month was 3.21 inches which is .30 less than normal. This rain fell on 12 days. In addition, there were traces of rain with a fall of less than .01 inch on 6 additional days. The total rainfall since January 1 is now 20.24 inches; the normal for this period is 20.96 inches. The mean temperature for the month was 66.7 degrees which is one degree higher than normal. The highest temperature was 90 degrees on the 11 th and the lowest, 42 degrees on the 7 th. The domestic heating load for the month was 40 degreedays, compared to a normal of 69 degree-days. The total heating load for the season was 6521 degree-days and the normal, 6812 degree-days.

There was a heary windstorm on the 17 th , with considerable damage to trees. The maximum velocity recorded was 48 miles an hour. There were 254 hours of bright sunshine which is 3 hours less than normal.

Dr. J. K. Shaw reports that "all fruit plants made normal progress during June. Tree fruits have set fair to good crops. Strawberries produced fair to good crops but raspberries and blackberries will be light due to winter injury to the canes. Rainfall has been rather short but timely showers have thus far prevented real injury to fruit crops. Scab control on McIntosh apple trees has not been as difficult as last year because of fewer humid periods, and thorough and timely spraying has been effective in control of the disease."

The third column gives extremes observed from 1889 to 1938

## REMARKS

The weather during July was very dry until the last few days of the month. Only 93 of an inch fell until July 27. This light rainfall in July with a deficiency of 1.45 inches in May and .30 in June made a dry growing season with considerable damage to crops. The total rainfall for the month was 2.30 inches compared to a normal of 4.10 inches. The least rainfall we have had in July was .70 inch in 1929. The total precipitation since January 1 is now 22.54 inches. The normal precipitation for this period is 25.06 inches.

The mean temperature for the month was 71.2 degrees, the normal being 70.8 degrees. The highest temperature during the month was 93 degrees which occurred on the 7th and 8th. The lowest was 45 degrees on the 3rd. The total wind movement during the month was 3072 miles, the normal being 3422 miles. The maximum velocity was 25 miles on the 12 th. There were 283 hours of bright sunshine compared to a normal of 268 hours.

Dr. J. K. Shaw of the Pomology Department gives the following report: "The period of dry weather, which began in June, continued until July 27 with only one or two showers. During the last few days of July there were several showers, bringing sufficient water to relieve conditions for a week or two. The drouth did not become severe enough to do great damage to fruit crops though it must have interfered with the development of full size on early variet ies ripening in late July and early August. Lawns and shallow-rooted crops suffered more or less severely. If timely rains come during August, there will be, on the whole, little drouth injury to fruit crops during this season. The dry weather has made weed control easier and has been unfavorable to the development of diseases and certain insects, and shoukl favor the development of fruit buds for next season's crop."

The third column gives extremes observed from 1889 to 1938

## REMARKS

The weather during August was considerably warmer than usual with a mean temperature of 73.5 degrees. This is the highest mean for August in Amherst beginning in 1837. In August 1937 the mean was 73.3 degrees. The normal mean temperature for August is 68.6 degrees. Not only was the temperature unusually high but it was accompanied with high humidity on many days. The mean relative humidity for the month was 72.9 percent compared to a normal of 70.2 percent. The mean temperature for the three summer months June, July and August was 70.5 degrees. This has been exceeded only three times since 1837: in 1870 the mean temperature for the three months was 71.7 degrees; in 1876, 71.8 degrees; and in 1937, 70.6 degrees. The last three years have had the hottest summers since observations have been taken at the State College, beginning in 1889.

The rain fall during the month was 3.89 inches, the normal being 4.08 inches. Most of the rain fell in the form of local showers which were accompanied with an unusual amount of thunder and lightning.

There were 287 hours of bright sunshine compared to a normal of 237 hours.

Dr. J. K. Shaw of the Pomology Department gives the following report: "The weather during August continued reasonably favorable for fruit development. Timely showers prevented serious drought, and midseason and later varieties are sizing up well and developing good color. Probably due to the dry weather of late June and July, considerable internal cork is developing in certain varieties of apples and will cause serious losses in some orchards. The crop of McIntosh in the College orchard will be heavy and that of most other orchards fair to good. It is quite free of diseases but many apples show hail marks from the hail storm of early summer."

## MONTHLY SUMMARY

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1938.

## REMARKS

The weather during September was nearly normal in most respects. There was less rain than usual, with 2.97 inches, the normal being 4.26 inches. The total rainfall since January 1 is now 29.40 inches compared to a normal of 33.40 inches for this period. The mean temperature for the month was 61.4 degrees, while the normal mean temperature for September is 61.7 degrees. The highest temperature was 91 degrees on the 16th and the lnwest, 35 degrees on the 19th. There have been no killing frosts at the thermometer shelter, although there have been frosts on low ground in Amherst. The total wind movement for the month was slightly higher than normal and the highest wind velocity was 32 miles per hour on the 15 th. There were 218 hours of bright sunshine which is 17 hours more than normal.

Dr. J. K. Shaw of the Pomology Department gives the following report: "The weather during September has continued to be favorable for fruit development and ripening. Rainfall was rather deficient but not seriously so. Apples have sized up well where trees were not overloaded and are developing good color. No general frosts have occurred. The peach crop has been practically all harvested and was good on the few trees that survived the severe winters of a few years ago. Our Baldwin apple trees have not borne well since the cold winter of 1933-1934. Winter injury is probably responsible, at least in part, for the short crops."

## REMARKS

The weather during October was seasonable in most respects. The mean temperature for the month was 50.2 degrees, the normal being 50.5 degrees. The lowest temperature was 23 degrees on the $30 t h$. The first frost of the season occurred on October 15 which is the latest date for first frost recorded at this station. The normal date for the first frost is September 21. The domestic heating load for October was 460 degree-days. This. together with 155 degree-days in September, makes the heating load for the two months 615 degreedays. The normal for this period is $60+$ degree-days.

There was a deficiency in rainfall during each of the summer and fall months, beginning with May. As a result many wells went dry and town water supplies were threatened. This shortage of water continued through October until the 25 th. Only 1.70 inches of rain fell in October until that date. Rains during the last week brought the total for the month to 4.55 inches. The normal rainfall for October is 3.29 inches.

There were 159 hours of bright sunshine compared to a normal of 175 hours. The highest wind velocity was 39 miles per hour on the 28th.

Dr. J. K. Shaw of the Pomology Department makes the following comment: "The month of October marks the close of the 1939 season for fruits. The season has been generally favorable for the crops. The apple crop was very heavy, especially of McIntosh, and that of other fruits, fair to good. White the rainfall was deficient at times, causing some injury to shallow-rooted crops, fruits suffered but little from lack of water. There were no unseasonable spring or fall frosts. Hail caused damage in some orchards. The fruit grower should be well satisfied with the season of 1939. except in the very important matter of prices which are discouragingly low."

The third column gives extremes observed from 1889 to 1938

## RE.MARKS

The outstanding features of Norember weather were the large amount of sunshine and the lack of precipitation. Only 98 inch of precipitation was recorded during the month, the normal for November being 3.41 inches. In the storm on the 5 th, .93 inch of rain fell. This is the least precipitation ever recorded in November at this station, with the exception of Norember 1917, when . 63 of an inch fell. No snow fell during the month, with the exception of a trace on the 9 th and the 13 th. The normal snowfall for November is 2.34 inches and the normal date for first snow is November 6. Last vear 13.50 inches fell in November, which was the heaviest on record for November.

The mean temperature for the month was 36.8 degrees, the normal being 38.9 degrees. The lowest temperature was 18 degrees on the 1th, compared with a normal minimum of 12.9 degrees for November.

The domestic heating load for November was 846 degree-days; the normal, 783 degree-days. The load for the heating season thus far is $1+61$ degree-days, while the normal for this period is 1387 degree-days.

There were 158 hours of bright sunshine, the normal for November being 128 hours. Only three other years since 1889 had more hours of sunshine in November, viz. 1936, 161 hours; 1917, 170. and 1903. 182.

The third column gives extremes observed from 1889 to 1939

## REMARKS

The weather during January was featured by the continued cold spell which began the last week in December. January was the coldest since 1920, with a mean temperature of 18.5 degrees compared to 15.2 degrees in 1920. The highest temperature was 42 degrees on the 15 th, compared to a normal high for January of 51.1 degrees. The lowest temperature was -3 degrees on the 10 th, compared to a normal low of -7.1 for January. The mean maximum temperature for the month was 27.1 degrees and the mean minimum, 9.8. Only one other day, the 11th, was below zero with a reading of - 1: but only 5 days were above 32 degrees. While January was cold, it had a cotal of 171 hours of sunshine compared to the normal of 137 hours. This is the highest number of hours recorded in the month of January since 1924. The domestic heating load for the season to the end of January is now 4021 degree-days, whereas the normal number of degree-days for this period is 3814 , giving an excess of about 5 percent. The total precipitation for the month was 2.63 inches. The normal for January is 3.61 inches. A total of 5.75 inches of snow fell during the month. compared to the normal of 13.24 inches. The total wind movement for the month was 5091 miles, the normat being 5055 miles.

## REAMRKS

The month of February was warmer than normal and was marked by a severe blizzard on the 14th when 9 inches of snow fell and much drifting was caused by high winds. In the Boston area and other castern parts of the state $1+$ inches of snow fell which drifted badly and caused serious traffic tie-ups.

The mean temperature was 26.7 degrees, while the normal is 23.7 degrees. The maximum temperature of 46 degrees occurred on the 12 th and the minimum was -6 degrees on the 27 th. The normal maximum temperature for February is 50.5 degrees and the norma! minimum temperature. -7.4 degrees. The total precipitation of 2.72 inches was under the normal of 3.19 inches. A total of 15.50 inches of snow fell as compared to the normal of 13.99 inches. The heating load for the month was 1112 degree-days. The normal load for February is 1156 degree-days. The heating load thus far is 5133 degree-days: and the normal load for this same period is 4970 degree-days. The total wind movement was 5459 miles. The normal for February is 4776 miles. This marks the largest wind travel for lebruary since 1933 when 6029 miles were recorded. february 1918 had 5632 miles of wind travel. The maximum wind velocity of 40 miles per hour was recorded on the $1+$ th, the day of the blizzard. A total of 161 hours of bright sunshine was slightly higher than the lebruary normal of 158 hours.

The third column gives extremes observed from 1889 to 1939.

## REMARKS

March was much colder than normal, with more rain and snow than usual. The only warm, pleasant day was the last day of the month.

The mean temperature for the month was 30.1 degrees, compared to the normal of 34.4 degrees for March. This was the coldest March since 1926 when the mean temperature was 29.4 degrees. Last year the mean temperature for March was 30.9 degrees, with the month almost identical in character with March of this year.

The highest temperature was 59 degrees on the 31st and the lowest, 5 on the 2nd.

The mean temperature for the winter months December through March was 26 degrees compared to a normal of 27.5 degrees for this same period. The lowest temperature recorded during the winter was -6 on February 27.

The domestic heating load for March was 1082 degree-days, compared to the normal load of 949 degree-days. The total load for the months September through March is 6215 degree-days, while the normal for this same period is 5919 degree-days.

The total precipitation was 5.58 inches, while the normal for March is 3.70 inches. The snowfall for the month was 9.00 inches, compared to the normal of 7.47 inches. The total snowfall for the season thus far is 35.00 inches; the normal for this period is 45.54 inches.

The total hours of sunshine were 199, which is the normal for March. The wind velocity was 5493 miles for the month, compared to the normal of 5944 miles.

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1939.

## REMARKS

The past month was one of the coldest and wettest Aprils on record at this station.

The mean temperature for the month was 42.1 degrees, compared to the normal of 45.7 degrees. It was colder than this only twice since 1889, the year the station was first established, viz., 41.2 in 1926 and 41.7 in 1907. In 1917 it was also 42.1 degrees. The highest temperature was 74 on the last day of the month, and the lowest, 20 on the 14th. The lateness of the season was indicated by the fact that the winter ice on the college pond remained until the 10th.

The domestic heating load for the month was 686 degree-days, while the normal for April is 579 degree-days. The total heating load for the season thus far is 6902 degree-days, compared to the normal of 6498 for this period.

The precipitation for the month totaled 6.37 inches, the normal being 3.35 inches. This is the heaviest for April since 1929 and was exceeded only three times in the past 50 years. A total of 6.50 inches of snow fell, compared to the normal of 2.00 inches for April. The snow fell in two storms; the last one totalling 4 inches occurred on April 21 and 22. This is the heaviest snowfall on record at such a late date. The total snowfall for the season was 41.50 inches compared to the normal seasonal fall of 47.71 inches.

The sunshine and wind travel for the month were very nearly normal.

## Meteorological Observations

FOR

## MAY

1940
C. I. GUNNESS

OBSERVATORY
Latitude, $42^{\circ} 23^{\prime} 48.5^{\prime \prime} \mathrm{N}$. Longitude, $72^{\circ} 31^{\prime} 10^{\prime \prime} \mathrm{W}$.
Height of barometer above ground, 36 ft . Above sea level, 253.5 ft .
Height of wind instruments, 67 feet. Time used, E. S. T.

Requests for bulletins should be addressed to the AGRICULTURAL EXPERIMIENT STATION AMIHERST, MASS.

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1939.

## REMARKS

The weather during May was marked with rain above normal and less sunshine than usual. The total rainfall for the month was 5.67 inches. The rainfall during the storm on the 31 st was 2.58 inches. The normal rainfall for May is 3.60 inches. This makes a total rainfall of 17.62 inches for March, April and May. This has been exceeded only once in the 50 -year history of the station. In 1901 there was a total rainfall of 18.52 inches in these three spring months. There were only 182 hours of bright sunshine compared to the normal of 252 hours. Most of the deficiency occurred in the latter half of the month. Only three times during the last 50 years has there been less sunshine in May than the past month. In 1927 there were 137 hours ; in 1916, 181 ; and in 1901, 159. The temperature for the month was nearly normal with a mean of 57.2 degrees. The normal mean temperature for May is 57.1 degrees. There were no heavy frosts, the lowest temperature being 33 degrees on the 13th. The highest temperature was 82 degrees on the 15 th. The domestic heating load was 242 degree-days, the normal being 245 degree-days. The total heating load for the season is now 7143 degree-days, the normal for this period being 6743 degree-days.

Dr. J. K. Shaw of the Pomology Department makes the following report: "Although the past winter was a severe one, fruit plants came through with little injury. Peach fruit buds survived and the bloom was abundant. Raspberry canes suffered much less injury than in the previous winter. Apple varieties blossomed moderately or heavily, especially considering the heavy crop of last year which might be expected to limit fruit bud formation. Quite likely the dry sunny weather of last June favored fruit bud formation. The season of bloom was nearly a week later than the average and, because of much cold, cloudy weather, was much prolonged. There were a few sunny days favorable to bee flight and pollination. It cannot yet be said how well apples have set. The abundance of wet weather during the early season of growth favored scab infection and made scab control difficult."

The third column gives extremes observed from 1889 to 1939.

## REMARKS

The weather during June was in reverse seasonal order. The first seven days were warm and clear, with a mean temperature for the week of 70.6 degrees as compared to the normal of 62.4 degrees for that week. This period was followed by several days with nearly normal temperatures but with many showers, the month closing with a ten-day period of some of the coldest weather on record for this time of the year.

The mean temperature for the month was 64.6 degrees, the normal for June being 65.7 degrees. The highest temperature was 89 on the 4 th and 5 th; and the lowest 39 on the 22 nd, which is an unusually low reading for the last part of June. The precipitation totaled 2.46 inches, compared with the normal of 3.75 inches for June. Rain was recorded every day from the 24th to the 30th. The total precipitation from January 1 to June 30 is now 25.43 inches, while the normal for this period is 21.20 inches. There were 261 hours of sunshine, the normal for June being 257 hours. The total wind movement was 3894 miles, which is 309 miles greater than the normal for June.

Dr. J. K. Shaw of the Pomology Department reports: "While the precipitation during June was below normal, there were no dry periods sufficient to noticeably check the growth of vegetation. There were several rainy periods favorable for apple scab infection, and on trees not well sprayed much scab developed. The strawberry harvesting season was at its peak at the end of the month when frequent showers favored good size of berries but caused some decay. In spite of much unfavorable weather during apple bloom, there was a satisfactory set of fruit and there is promise of a good crop though less than last year."

Note-The first column in the above summary gives observations made during the month. The second eolmm gives the averages based on observations made from 1889 to 1938 , except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1939.

## REMARKS

The weather during the first two weeks in July was cold, while the last half of the month was unusually hot. As a result, the average temperature for the month was practically normal, the mean being 70.6 degrees. The normal mean temperature for July is 70.8 degrees. The highest temperature during the month was 94 degrees on the 26th. The normal maximum for July is 93.9 degrees. The weather during the last 10 days was made uncomfortable by the high humidity which accompanied the relatively high temperature. The mean relative humidity for the month was 76.3 percent, compared to a normal of 68.4 percent. A similar spell of hot weather was experienced from the 4 th to the 11th day of July in 1937. The temperature was higher during that period than during the hot days in the past month, but the humidity was not as high. There was rain on 15 days during the month but many of these rains were light showers. A very heavy rain of 1.18 inches fell in half an hour on July 18. The total rainfall during the month was 4.69 inches, the normal for the month being 4.10 inches. The total rainfall since January 1 is now 30.12 inches, the normal for this period being 25.30 inches. There were 259 hours of bright sunshine compared to a normal of 268 hours. The total wind movement during the month was 2869 miles. This is considerably less than normal, as the average wind movement for July is 3422 miles.

The third column gives extremes observed from 1889 to 1939.

## REMARKS

The weather during August was colder than usual with a mean temperature of 66.9 degrees. The normal mean temperature for August is 68.6 degrees. The lowest temperature was 34 degrees on the 25 th. This is the lowest August temperature recorded at this station. The nearest approach to this minimum was 37 degrees on August 22, 1894 and August 29, 1908. There was frost on August 25 on low land in town, particularly in South Amherst, with damage to tobacco. corn and other crops. The highest temperature was 89 degrees on the 10th. Rainfall was considerably less than normal, being 1.56 inches. The normal rainfall for August is 4.08 inches. There were 263 hours of bright sunshine compared to a normal of 237 hours. The wind movement was 3219 miles which is slightly above normal. The mean relative humidity for August was 70.2 percent.

Dr. J. K. Shaw of the Pomology Department makes the following report: "Apples are gaining size somewhat slowly due to cool weather and perhaps in some cases lack of abundant rains. Some varieties are a week or more later than the average. These conditions, especially cool nights, have favored color development in red varieties so that early and mid-season varieties are showing much better color development than usual. Early peach varieties have matured good crops and later varieties are coming on well though somewhat later than normal. Pears are making a heavier crop than usual. The blueberry crop is about over and the yield was rather light due to winter injury to the plants. The frost ot August 25 that caused much injury to tender crops did not harm fruit crops."

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1939.

## REMARKS

The outstanding feature of the weather for September was the small amount of rain. The total for the month was 1.53 inches, as compared to the normal for September of 4.24 inches. Only three times in the past 52 years has the rainfall for September been less. In 1926, only 1.50 inches fell: in 1916, 1.37 inches: and in 1914, .52 inch. The total rainfall since January 1 is now 33.21 inches, compared to a normal of 33.62 inches.

The mean temperature for the month was 60.1 degrees, the normal being 61.7 degrees. The highest temperature was 85 degress on the 21 si . The lowest was 30 degrees on the 27 th, and this was the first killing frost of the season at the observatory. There have been carlier frosts, however. on low ground in the town of Amherst. There were 239 hours of bright sunshine compared to a normal of 201 hours. The mean humidity was 79 percent, while the normal mean humidity is 73.6 percent. The wind movement was very nearly normal, with no high winds.

Dr. J. K. Shaw of the Pomology Department makes the following report: "The retarded development of apples and other fruits noted last month continued through September, and all varieties are more or less late in coming to maturity. There is much les pre-harvest drop of apples than usual and the fruit has colored well. A general frost on the night of September 27 killed late tender crops hut did no harm to fruit crops. Coming later than usual, the frost did no more damage to field and garden crops than usual."

The third column gives extremes observed from 1859 to 1939.

## REMARKS

The weather during October was clear, cool and dry. Rain in excess of .01 inch fell on only 4 days, although there were traces of rain on 7 additional days. The total rainfall for the month was 1.04 inches, the normal rainfall for October being 3.29 inches. The total precipitation since January 1 is now 34.25 inches. The normal for this period is 36.91 inches.

The mean temperature for the month was 46.7 degrees. the normal being 50.5 degrees. This is the coldest October since 1925 when it was 43.5 degrees. The highest temperature was 76 degrees on the 7 th and 12 th. The lowest temperature was 19 degrees on the 22 nd and 28 th. Only twice during the last 52 years has the temperature been lower than 19 degrees in October. In 1936 it fell to 17 degrees and in 1904, to 18 degrees. The domestic heating load for October was 560 degree-days. There were 183 degree-days in September. The total for September and October is, therefore, 751 degree-days. The normal for these two months is 604 degree-days. There were 220 hours of bright sunshine compared with a normal of 175 hours. There were no unsually high winds.

Dr. J. K. Shaw of the Department of Pomology gives the following report: "Sub-normal temperatures continued through October and there were several sharp freezes during the last half of the month. Some apples remained on the trees during one or more of these freezes and those going through more than one or two of them must have been injured. The total amount of such fruit was small. Late varieties did not size up well. The leaves were frozen prematurely and this was not favorable for the trees and makes them less able to withstand severe freezing if such should occur this winter. Rainfall was also below average and unless abundant rains occur before the ground freezes, the trees will go into the winter under somewhat unfavorable conditions."

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1939.

## REMARKS

The outstanding feature of November weather was the high rain and snowfall. The total precipitation for the month was 6.31 inches. Of this amount, 2.25 inches fell as rain on the 2 nd and 1.30 inches fell as snow on the 26th and 27th. A total of 13 inches of snow fell during the month, the storm on the 26th and 27th giving 11 inches. This heavy snowfall in November has been exceeded only once in the history of the station. A total of 13.50 inches of snow fell in November 1938. On the 24th and 25 th of November of that year there was a fall of 11.50 inches. The total precipitation since January 1 is now 40.56 inches, the normal for this period being 40.32 inches.

The mean temperature for the month was 39.4 degrees. The normal mean temperature for November is 38.9 degrees. The highest temperature was 69 degrees on the 22nd and the lowest, 11 degrees on the 29th. The domestic heating load for the month was 709 degree-days the normal being 783 degree-days. The total heating load for the season is 1520 degree-days, the normal for this period being 1386 degree-days. There were only 81 hours of bright sunshine, whereas the normal for November is 121 hours. The total wind movement for the month was 4986 miles, the normal being 4531 miles. The highest wind velocity was 32 miles per hour on the 3rd.

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938 , except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1940.

## REMARKS

The weather during January was colder than usual and had a heavy fall of snow. The mean temperature for the month was 21.2 degrees which is 3 degrees lower than usual. However, it was 2.7 degrees warmer than January 1940. The lowest temperature was -9 degrees on the 30 th and the highest was 42 degrees on the 23 rd. The domestic heating load for the month was 1358 degree-days compared to a normal of 1265 degree-days. The total heating load for the season is 3982 degree-days, the normal for this period being 3814 degree-days.

The total precipitation for the month was 2.21 inches, the normal being 3.61 inches. The total snowfall was 22.75 inches of which 12 inches fell on January 24. The normal snowfall for January is 13.32 inches. The total snowfall for the winter is now 40.75 inches, the normal for this period being 24.16 inches. There were 191 hours of bright sunshine compared to a normal of 137 hours. The highest wind velocity was 28 miles per hour.

## REMIARKS

The weather during February was marked with less rain and snow than usual, a large amount of sunshine and higher mean temperature than usual. The total precipitation for the month was 1.59 inches compared to a normal of 3.19 inches. The snowfall was 2.25 inches, while normally we get 13.99 inches of snow in February. This is the least snowfall for February on record here at the station with the exception of 1937 when one-half inch fell during the month. There were 212 hours of sunshine, the normal being 158 hours. This has been exceeded only three times at the station, viz., 1919, 1920 and 1924. It will be noted that two of these years were leap years with 29 days in February.

The mean temperature for the month was 25.8 degrees. The normal mean temperature for February is 23.7 degrees. The domestic heating load for the month was 1099 degree-days, the normal being 1156 degree-days. The total heating load for the current season is 5081 degree-days. The normal to this date is 4970 degreedays. The average wind velocity for the month was 7.9 miles per hour, the normal being 7.1 miles per hour. The highest velocity was 40 miles per hour on the 15 th.

Note-The first column in the above summary gives observations made during the month. The second eolumn gives the averages based on observations made from 1889 to 1938 , except that humidity records are based on observations made from 1929 to 193S. The third column gives extremes observed from 1889 to 1910.

## REMARKS

The weather during March was clear, cold and windy. The mean temperature was 30.3 degrees, the normal mean being 34.4 degrees. The highest temperature was 54 degrees on the 23 rd and the lowest, 6 degrees on the 18th. The domestic heating load was 1074 degree-days compared to a normal of 949 degree-days. The total heating load for the season is now 6155 degree-days, the normal for this period being 5919 degree-days. There were 256 hours of bright sunshine, the normal being 199 hours. The total precipitation was 1.63 inches where as the normal precipitation for March is 3.70 inches. The snowfall was 15.50 inches. Normal snowfall for March is 7.47 inches. The total snowfall for the winter is now 58.50 inches, the normal for this period being 45.62 inches. The total wind movement for the month was 6449 miles, which is well above the average for March. The highest velocity was 48 miles per hour on the 18th.

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, exeept that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1940 .

## REMARKS

April weather was unusual in many respects, being dry, warm and sunny. The rainfall during the month was only .55 of an inch. This is the least rainfall in Amherst for April since 1836. Other dry Aprils were in 1844 and 1892 when .57 and .76 of an inch respectively were recorded. The normal rainfall for April is 3.35 inches. The total rainfall since January 1 is 5.98 inches while the normal for this period is 13.85 inches. The most serious results from the dry spell have been the disastrous forest fires throughout the state.

The mean temperature for the month was 52.1 degrees compared to a normal of 45.7 degrees. This is the highest mean April temperature in Amherst since 1837 except for the year 1839 when a temperature of 52.2 degrees was recorded. The week beginning April 14 was the most unusual period. A mean temperature of 65 degrees was recorded during that week. This has never been equalled during April since 1889 and has been exceeded only three times during the month of May. The highest temperature recorded was 90 degrees on April 20. The heating load during the month was 399 degree-days, the normal being 579 degree-days. The total heating load during the season is now 6554 degree-days, compared to a normal of 6498 degree-days for this period. There were 329 hours of bright sunshine, which is the highest number of hours recorded in April. The normal is 220 hours.

Dr. J. K. Shaw, Research Professor of Pomology, makes the following comments: "Nost fruit plants came through the winter in good shape except raspberry canes which were badly killed back, perhaps by the severe cold of December 10. Peach buds survived the winter without excessive killing. March was cold with subnormal precipitation but in early April there came an excessively warm period which caused rapid development of foliage and flower buds. Colder weather followed, causing some injury to flower buds of apples, killing many pistils. The extent of this injury is not yet known but apple orchards in low frosty locations have probably suffered severe damage. No serious injury to peach, pear, and plum buds has been observed. Rarely has vegetation been so far advanced at the end of April. There remains a danger period of two or three weeks during which damage from cold is very possible. April was very dry. Fruit plants have not suffered yet but if heavy rains do not come in May, growth will be severely checked."

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1940.

## REMARKS

The weather during May continued dry but in other respects was quite normal. The rainfall during the month was 2.87 inches, the normal for May being 3.60 inches. There was only one good rain during the month, on the 8th, 9th and 10th, hence the drouth has continued to the end of the month. The total rainfall since January 1 is now 8.85 inches, while the normal for this period is 17.45 inches.

The mean temperature for the month was 57.9 degrees which is 0.8 of a degree higher than usual. The highest temperature was 89 degrees on the 22 nd and the lowest, 30 degrees on the 4 th. A temperature of 32 degrees on the 13th brought the last frost of the month near the observatory, although there were later frosts in the low part of the town. The domestic heating load during the month was 247 degree-days. The normal for May is 287 degree-days. The total heating load for the season is now 6801 degree-days, while the normal for the period is 6785 degree-days. There were 338 hours of bright sunshine which is the largest number of hours ever recorded in May. No high winds were recorded.

Dr. J. K. Shaw, research professor of Pomology, makes the following report: "The month of May was characterized by a continued deficiency of rainfall. This has not as yet caused any apparent injury to fruit trees which are still making good growth, but there will be a short hay crop even if there should be ample rain soon. It also sets the stage for more severe damage should rainfall continue to be low. Fruit trees bloomed ten days or more earlier than normal. Frosts killed a few apple blossoms but not enough to interfere with the crop unless it may be in orchards in frosty locations. Considerable cool weather has delayed the progress of vegetation somewhat but it continues to be more advanced than normal. There were few wet periods favorable to apply scab infection, and scab control should be easier than last year. Strawberries are beginning to ripen a week or more earlier than normal. We may expect a light raspberry crop because of cold injury which probably was caused by the cold of December 4 and not on the 10th as stated last month."

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938 , except that humidity records are based on observations made from 1929 to 193 S . The third columm gives extromes ohserved from 1889 to 1910.

## REMARKS

June weather was warmer than usual, with more precipitation and sunshine than normal.

The mean temperature for the month was 67.2 degrees, compared to the normal for June of 65.7 degrees. The highest temperature was 94 on the 27 th and the lowest, 44 on the 12 th. Two warm spells occurred during the month, the first from the 19th to the 23 rd and the second from the 26th to the end of the month. Most of the daily maximum temperatures during these warm spells ranged in the 90 's. While these periods were very warm, they were not as prolonged and as humid as the 8-day heat wave of June, 1938, and the 10 -day period in 1933. The domestic heating load for the month was 60 degree-days. The normal for June is 69 degree-days. The total load for the heating season was 6861 degree-days, while the normal for the period is 6854 degree-days.

The total rainfall during the month was 6.13 inches which reduced to some extent the large deficiency in rainfall which has prevailed since the first of the year. The normal for June is 3.75 inches. The total rainfall since January 1 is now 14.98 inches, while the normal for this period is 21.20 inches. There were 328 hours of sunshine. This record has been exceeded only twice in June- 360 hours in 1923 and 362 in 1908. The normal for June is 257 hours. The total wind movement for June was slightly higher than normal, although the four-day wind travel from the 8 th to the 11 th was unusually high and steady.

Dr. J. K. Shaw, research pomologist, gives the following report on the progress of vegetation: "A few timely rains maintained soil moisture and increased the hay crop above the prospects in early June. Yet there was not enough continued wet weather for extensive apple scab development, so that control was much easier than last year. Apples set well and the MicIntosh crop promises to be good, but Baldwins are reported a light crop due to light bloom. The strawberry harvest is about over and the crop was average. The progress of vegetation during June was not far from normal."

The third column gives extremes observed from 1889 to 1910.

## REAIARKS

The weather during July was very near normal in most respects. The mean temperature for the month was 71.2 degrees, the normal being 70.8 degrees. The highest temperature was 93 degrees on the 2nd and the lowest, 49 degrees on the 21st. The rainfall during the month was 4.04 inches which is .06 less than normal. The heaviest rainfall of the month was 1.90 inches on the 28th. The total rainfall since January 1 is now 19.02 inches, while the normal for this period is 25.30 inches. There were 300 hours of bright sunshine compared to a normal of 268 hours. The mean relative humidity was 72.9 per cent while the normal for July is 68.4 per cent.

Dr. J. K. Shaw reports as follows: "The weather during July continued to be favorable for the development of fruit plants. Timely showers supplied ample soil moisture for growth of both trees and fruits. A heavy shower accompanied with high winds on July 28th damaged a few trees and blew over some corn and tobacco. The dry spring was followed by sufficient precipitation and seems to have given conditions very favorable to growth. Apple trees have grown much better than last year. High temperatures in early spring which brought trees in bloom very early still show their effect in unusually early maturity. The blueberry crop ripened nearly three weeks earlier than last year."

The third column gives extremes observed from 1889 to 1940.

## REMARKS

August was slightly cooler than normal, had less rain than usual and had an unusually large amount of sunshine. The mean temperature for the month was 67.1 degrees which is 1.5 degrees cooler than normal. The highest temperature during the month was 91 degrees on the 3th and the lowest 41 degrees on the 18 th. The mean temperature for the three summer months, June, July and August, was 68.5 degrees, while the normal mean temperature for these months is 68.7 degrees. The highest temperature during the summer was 94 degrees on June 27 . 'The total rainfall during August was 1.79 inches, the normal being 4.08 inches. The total rainfall since January 1st is 20.81 inches while usually we get 29.38 inches during this period. There were 332 hours of bright sunshine compared to a normal of 237 hours. This is the largest amount of sunshine ever recorded in August at this station. The nearest approach to this high amount was 317 hours in 1921. The mean relative humidity was 60.3 per cent, the normal being 70.2 per cent. The total wind movement was 4030 miles. The normal wind movement for August is 3127 miles. The highest wind velocity was 40 miles per hour on the 12 th.

Dr. J. K. Shaw makes the following report: "The progress of vegetation during August has been about normal. The effects of the early start in the spring are still seen in the early ripening of most varieties. There are still some signs of a low water supply but not more than in most seasons. Apple scab is less prevalent than usual, partly because of little weather favorable to infection last spring. Vegetative growth of most fruit plants through the season has been better than usual. This suggests that a dry spring followed by adequate summer rainfall is favorable to fruit plants, if not for the hay crop."

## MONTHLY SUMMARY

Note-The first column in the above summary gives observations made during the month. The second column gives the averuges based on observations made from 1889 to 193 , except that humidity records are based on observations made from 1929 to 1938 . The thimd eohbmangives extremes observed irom 1859 to 1910.

## REMARKS

The weather during September was dry, warm and clear. The total rainfall during the month was 2.88 inches compared to a normal of 4.26 inches. The total rainfall since January 1 has been 23.69 inches, while the normal rainfall for this period is 33.62 inches. This deficiency of almost 10 inches has resulted in acute water shortage in wells and reservoirs. The rainfall since April 1 has been 18.26 inches or 4.85 inches less than normal for that period with some damage to crops.

The mean temperature for the month was 62.5 degrees, the normal being 01.7 degrees. There was a light frost on the 20th on nearby lowland and a heavy frost on the 30th with a temperature of 28 degrees at the observatory. The normal date for the first frost is Sept. 21st. The domestic heating load for the month was 149 degree-days, which is normal for September. There were a total of 307 hours of bright sunshine, which is the largest amount of sunshine ever recorded at this station in September.

Dr. J. K. Shaw of the Pomology Department makes the following report: "The weather during September has been very dry. l.eaves are dropping from some apple trees prematurely. This may result in poor foliation in the spring. Unless there are abundant rains soon, fruit plants will go into the winter in poor condition. The lack of rainfall has not interfered with the crop of this year and plenty of sunshine has favored good color development. The apple crop is of very good quality, but not large. There seems to be good fruit bud formation for next year's crop."

Note - The first column in the above summary gives olservations made during the month. The second column gives the averages based on observations made from 1889 to 1939 , except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1940 .

## REMARKS

The drouth continued through October with a rainfall of only 2.13 inches, the normal for October being 3.29 inches. The total precipitation since January 1 is now 25.82 inches whereas the normal for this period is 36.91 inches. Reports have come in of additional wells going dry during the month.

The mean temperature of the month was 52.5 degrees which is 2 degrees higher than normal. The highest temperature was 88 degrees on the 5 th and the lowest 24 degrees on the 29 th. The domestic heating load was 407 degree-days, the normal for October being 456 degree-days. There were 165 hours of bright sunshine compared to a normal of 175 hours.

Note-The first columa in the aboces :mmanery sives observations made during the month. The seeond eolumn gives the averate based on ohservations made from 1889 to 1939, except that hmmidity records are based on onservations made from 1929 to 1933 . The thim momm gives extremes observed from 1 sse to 1910.

## REMARKS

The weather during November was warmer than usual, more sunshine than normal, and heavy rainfall during the first part of the month. The mean temperature for the month was 42.8 degrees, the normal being 38.9 degrees. This is the warmest November at Amherst since 1889, except for four years. It was equalled in 1934 and exceeded in 1927, 1931, and 1935 with mean November temperatures of $43.9,44.1$ and 43.4 degrees. The highest temperature was 74 degrees on the 19th, which was the highest temperature ever recorded so late in the season at this station. The lowest temperature was 19 degrees on the 25th. The domestic heating load for the month was 667 degree-days, the normal for November being 784 degree-days. The total degree-days for the season is now 1223 degree-days compared to a normal of 1389 for that period. There were 135 hours of bright sunshine, the normal for November being 121 hours. The total rainfall for the month was 4.29 inches, whereas the normal for November is 3.41 inches. Of this amount, over 2 inches fell on the first day of the month and $11 / 2$ inches on the 6 th and 7 th. The total rainfall since January 1 is now 30.11 . The normal being 40.32 inches. Snow flurries were seen on the 12th and 26th.

## Meteorological Observations

FOR

## DECEMBER

$$
1941
$$

C. I. GUNNESS

OBSERVATORY
Latitude, $42^{\circ} 23^{\prime} 31^{\prime \prime} \mathrm{N} . \quad$ Longitude, $72^{\circ} 31^{\prime} 48^{\prime \prime} \mathrm{W}$.
Height of barometer above ground, 36 ft . Above sea level, 253.5 ft . Height of wind instruments, 67 feet. Time used, E. S. T.

Requests for bulletins should be addressed to the AGRICULTURAL EXPERIMENT STATION AMHERST, MASS.

Note - The first column in the above summary gives observations made during the month. The second column gives the averages besed on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1911 .

## REMARKS

The weather during January was very near normal except that there was less snow than usual. Only 6.5 inches of snow fell during the month while we get an average of 13.32 inches of snow in January. The snowfall for the current season thus far is only 8.5 inches, while the normal for this period is 24.16 inches. The total precipitation during the month was 3.54 inches, the normal for January being 3.61 inches. The mean temperature during the month was 24.1 degrees compared to a normal of 24.2 degrees. The lowest temperature was -13 degrees on the 8 th. The domestic heating load during the month was 1267 degree-days, the normal for January being 1265 degree-days. The total heating load for the season to the end of January is 3539 degreedays, while the normal for this period is 3817 degreedays. There were 159 hours of bright sunshine which is well above the average of 137 hours. The mean relative humidity was 68.4 per cent, the normal being 70.1 per cent.

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938 , except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1911.

## REMARKS

The weather during February was marked by the small amount of rain and snow, the high wind, and the large amount of sunshine. The temperature was very near normal, with a mean temperature of 24 degrees, the normal being 23.7 degrees. The highest temperature was 44 degrees on the 17 th and the lowest 0 on the 3rd and 4th. The normal low temperature for February is -7.4 degrees. It may be interesting to recall that the lowest temperature ever recorded at the station was -22.5 degrees in February, 1918. The domestic heating load for the month was 1149 degree-days, the normal for February being 1165 degree-days. The total heating load for the season is 4688 degree-days. The normal heating load to the end of February is 4982 degree-days. The normal heating load for February is based on the 50 -year record including 11 leap years and hence is high compared with years which are not leap years.

The total precipitation for the month was 1.66 inches, while the normal for February is 3.19 inches. It is interesting to note that the precipitation in February, 1941 was 1.59 inches. The total precipitation for January and February of this year is 5.20 inches whereas for the same period in 1941 it was only 3.80 inches. Only 8 inches of snow fell in February compared to a normal of 13.99 inches. The total snowfall for the winter is 16.50 inches, while the normal to the end of February is 38.15 inches. There were 190 hours of bright sunshine, the normal being 158 hours. The total wind movement during the month was 6531 miles which is the highest ever recorded in February. The nearest to this record was 6445 miles in 1896. The normal for February is 4776 miles. The highest wind velocity was 32 miles per hour on the 13 th and 21 st. The wind blew from the northwest on 21 days.

The second column gives the averages based on observations made from 1889 to 1938 , except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1941.

## REMARKS

The weather during March was warmer than usual, with a large amount of rain. The mean temperature during the month was 39.4 degrees which is 5 degrees warmer than usual. The highest temperature was 63 degrees on the 8th and the lowest 26 degrees on the 27th and 29th. This is the highest minimum for March ever recorded at this station. The nearest was 21 degrees in March, 1889 and the next 19 degrees in 1903. The College Pond was clear of ice on March 20. This is about 10 days earlier than usual. The domestic heating load for the month was 792 degree-days. The normal is 950 degree-days. The total heating load for the season to the end of March is 5480 degree-days, while the normal for this period is 5932 degree-days.

The total precipitation during the month was 7.89 inches. This is the greatest precipitation ever recorded at this station during March. The nearest to this record was 7.13 inches in 1899. The normal for March is 3.70 inches. The total for the three-month period beginning at New Year's is 13.09 inches while the normal for this period is 10.50 inches. The total snowfall during the month was 7.25 inches which is slightly less than normal. The total snowfall to the end of March was 23.75 inches while the normal for that period is 45.62 inches. During the winter of 1936-1937 the total snowfall was 23.25 inches.

There were 205 hours of bright sunshine which exceeds the normal value by 6 hours.

## REMARKS

The weather during April wat dry and warm, quite smimar to April $19+1$ although not quite as extreme. The mean temperature for the month was 49.7 degrees, the normal being 45.7 degrees. Last year. April had a mean temperature of 52.1 degrees. The donestic heating load of the month was 458 degree-days, compared to a normal of 579 degree-days. The total heating load for the season to the end of April is 59.38 degree-days whereas the normal for this period is 6511 degree-days. The total precipitation for the month was. 96 of an inch. Last year only .55 of an inch of rain fell in April. Five inches of snow fell during the month. The normal rainfall for April is 3.35 inches. The total precipitation since January 1 st is now $1+.05$ inches, the normal for these four monthis being 13.85 inches. There were 245 hrours of bright sunshine. The nomat smatine for April is 220 homss.

Dr. I. K. Shaw, Researeh Professor of Pomology, makes the following comments: "The past winter wats not severe, yet there was some injury to fruit plants. The bardier varieties of peaches came throush with plenty of live fruit hots, hat those of tender sarieties such as Eiberta, were all killed. The amomot of killinge will vary with different orehards: therefore the peach crop will be small and spotty depending on the site and varieties. Raspberry cancs show considerable winter injury, especially among the more tender varieties. As last year, this season is now far advancer and with little rainfall. Vegetation is at just about the same stage as it was a year aso. Last year was, on the whole, very favorable to fruit plants. If, as last year, we escape a too prolonged drought and spring foosts, fruit crops, except peaches and raspberries, should be goocl. Apple trees are beginning to hoom plentifully. Frost injury to lowsoms and young apples is mansual in this area, but the earlier the bloom, the inore danger of frost injury: Mclntosh trees are especially full of bloom."

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity rccords are hased on observations made from 1929 to 1938. The thind column gives extremes observed from 1889 to 1941.

## REMARK゙S

The weather during May was normal in most respects except that the temperature was higher than usual. The mean temperature for the month was 01.4 degrees, while the normal is 57.1 degrees. This mean temperature has been exceeded only twice in May since 1889, in 1911 and 1918. In 1911 the mean was 62.5 degrees and in 1918, 62.2 degrees. The highest temperature wat 87 degrees on the 30th and the lowest, 31 degrees on the 11 th. These are nomal ranges of temperature for May. The last frost of the month occurred on May 11. The domestic heating load for the month was $1+4$ degreedays as compared to a normal of 287 degree-days. The total heating load for the season is now 6082 degree-days compared to a normal of 6798 degree-days. In other words, the heating load during the current year has been only 90 percent of the normal value.

The total precipitation for the month was 2.98 inches, the normal being 3.60 inches. This brings the total precipitation since January 1 to 17.03 inches which is 0.42 less than normal for that period. There were 258 hours of bright sumshine which is 6 hours higher than the average. There were no high winds during the month.
1)r. I. K. Shaw, research pomologist, makes the following statement regarding the progress of vegetation: "W"eather during May wats seasomalle and fruit plants have mate normal progress. The hlown of apple trees was very carly, about the same date as last year. Bloom was very heavy. Many trees, especially Mchatosh, that prorluced a good crop last year bloomed heavily. Conditions for pollination were good and set of young apples seems to be heavy. Some frost injury was reported from low-lying orchards but indications now point to one of the heaviest apple crops in recent years. The peach bloom was better than anticipated but varieties tender in bud show little or no bloom. Strawberries are beginning to ripen the first of June. The prospects are for a good hneberry erop but rasplerries nay be a short crop owing to winter injury to the canes."

The third column gives extremes observed from 1889 to 1941.

## REMARKS

June was a good growing month in Amherst. Rainfall was very near normal. Temperature was higher than usual and there was more sumshine than normal. The total precipitation for the month was 3.63 inches while the nurmal is 3.75 inches. This brings the total precipitation since January 1 to 20.66 inches, the normal for this period being 21.20 inches. The mean temperature for the month was 67.5 degrees compared to a normal of 65.7 degrees. The highest temperature was 90 degrees on the 13 th. The domestic heating load for June was 42 degree-days the normal being 68 degree-days. The heating load for the season is 6124 degree-days while the normal is 6866 degree-days. Amherst residents should therefore have burned 11 percent less fuel than normal during the past winter.

There were 285 hours of bright sumshine. The normal for June is 257 hours. There was slightly less wind than normal with a total movement of 3043 miles. There were no high winds, the highest leing 28 miles per hour on the 15 th.

Dr. I. K. Shaw, research pomologist, makes the following comment regarding vegetation: "Progress of vegetation during June has been normal. There has been sufficient rain to keep plants growing well. Nights have been rather cool for best growth of warm weather crops. The hay crop is good and grass has started well towards a second crop. There has been a heavy June drop of McIntosh, hut in most orchards enough apples remain to make a good crop. Considerable scab appears in some orchards, lut those sprayed thoronghly and at the right time are quite free from it. The strawberry crop was generally disappointing. There was some rot, and berries failed to set and develop well. Peaches and raspberries will be short due to winter cold. Bheberries promise a good crop."

## REMARKS

The weather during July was very near normal in most respects. The mean temperature for the month was 70.5 degrees, the normal being 70.8 degrees. The highest temperature was 93 degrees on the 19 th and the lowest 47 on the 9 th. The rainfall during the month was 4.95 inches which is .85 more than normal. The greater part of this rain fell in two storms: on the 1st, 2nd and 3 rd, 1.84 inches was recorded and on the 27 th, 1.32 inches. The total rainfall since January 1 is now 25.61 inches while the normal for this period is 25.30 inches. There were 291 hours of sunshine compared to a normal of 268 hours. The mean relative humidity was 73.6 percent while the normal for July is $68 .+$ percent.

Dr. J. K. Shaw reports as follows: "The progress of vegetation during duly continued to le normal. Timely rains have favored growth and practically all fruit plants grew well. Ripening dates are yet a week or more earlier than usual, reflecting the early bloom. The peach crop will be rather light especially that of varieties laving fruit louds tender to winter cold. Apples, especially MicIntosh, continue to promise crops above normal. The blueberry crop is larger than usual and pears and plums seem about nornal."

Note--The first colmm in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to $19+1$.

## REMARKS

The weather during August was very near normal in most respects. There was more sunshine and less rain than usual. The mean temperature for the month was 68.9 degrees which is 0.3 of a degree higher than normal. The highest temperature was 91 degrees on the 22 nd and the lowest 41 degrees on the 26th. The rainful during the month was 2.93 inches, the normal for August being 4.08 inches. The total rainfall since January 1st is 28.54 inches compared to a normal of 29.38 inches for this period. There were 288 hours of bright sunshine while the normal for August is 237 hours. The mean relative humidity was 73.9 percent. The normal for August is 70.2 percent. Total wind movement for the month was 2790 miles which is 337 miles less than normal.

Dr. J. K. Shaw, research pomologist, makes the following report on the progress of vegetation: "The season continues to be nearly normal in all respects. There has been sufficient rain to permit vegetation to progress well. Towards the end of the month there were cool nights that noticeably improved the color of McIntosh and other red varieties of the same season, though a clear atmosphere that is likely to accompany cool nights may be the real reason. Rainfall was deficient towards the last of the month, but at this season there is little danger of injury to crops from dry weather. The promise of good crops of all fall-ripening fruit continues."

The third colum gives extremes observed from 1889 to $19+1$.

## REMARKS

The weather during September wan nearly nomal in most respects. The mean temperature wats only one degree higher than normal for the month but was musmally high during the third week. The highest temperature wat 90 degrees on the 210 d and the lowest, 28 degrees on the 30 th. The first frost was on the 2yth while the normal date for the first frost is September 21.

The donestic beating load for the month was 138 degreedays. The nomal for september is $1+9$ degree-day

The ramfall during the month wa, $3.9+$ inches, the momal for feptember being 4.26 inches. The total precipitation since January 1 is 32.48, while the nomal is 33.62 inches. There were $22+$ hours of bright sunshine compared to a mornal of 201 lomes. The total wind movement was only 2707 miles while the normal is $32 / 1$ miles. The highest wind velocity was 28 mile per hour on the $28 t h$.

Dr. I. K. Shaw, reacarch promologist. comment as follows: "Alternate cool and warm periols prevaled luring September. A wam, moist period came in the midst of the Achntom harvent and was probably the principal camse of an monally heary pre-harvest drop. The Melntosh crop, was even larger that expected; the fruit was of gow size and farly well colored; it matured a little earlier than matal. The below freezing temperature of the 20th and 30 th maty have injured the keeping quality of apples still on the trees, hat 10 serions harm is expected. All tender vegetation wan completely killed."

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1941.

## REMARKS

The weather during October was unusually pleasant, being warm and clear. The mean temperature for the month was 52.7 degrees as compared to a normal of 50.5 degrees. The highest temperature was 76 degrees on the 9th and the lowest, 26 degrees on the 29th. The domestic heating load for the month was 382 degree-days as compared to a normal of 456 degree-days. The total for September and October is 520 degree-days, the normal being 605 degree-days. The heating load for September and October represents $7.6 \%$ of the total heating load for the season.

The rainfall during the month was 3.27 inches which is .02 less than normal. The total rainfall since January lst is now 35.75 inches while the normal for this period is 36.91 inches. There were 195 hours of bright sunshine during the month. The normal for October is 175 hours. There were no high winds during the month and the total wind movement was 3209 miles compared to a normal of 4074 miles.

## REMARKS

We had a large rainfall during November, the total for the month being 6.07 inches. The normal for the month is 3.41 inches. The total precipitation since January $l$ is 41.82 inches while the normal for this period is 40.32 inches. Only traces of snow fell during the month. There were iraces of snow in the air on the 12th and 13 th but a heavier trace on the 27 th is reported as the first snow of the season. The normal date for the first snowfall is November 6 while the latest date for the first snowfall previously observed is November 27.

In spite of 11 days of rain the total hours of bright sunshine was 130 which is well above the average of 121 houis.

The mean temperature during the month was 38.8 degrees, the normal being 38.9 degrees. The lowest temperature was 15 degrees on the 23rd. The domestic heating load was 784 degreedays which is the normal for November. The total heating load for the season to the end of November is now 1304 degree-days or 19 percent of the normal heating load of the whole season. The normal heating load to the end of November is 1389 degreedays. The mean relative humidity was 72.2 percent. The highest wind velocity was 40 miles on the 10th.

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to $19+1$.

Note- The first colum in the above smmary gives obervations made during the month. The second colum gives the averages based on olservations made from 1889 to 1938 , except that humidity records are hased on observations made from 1929 to 1938 . The third column gives extremes observed from 1889 to $19+2$.

## REMARKS

The weather during January was more severe than usual. The mean temperature during the month was 21.4 degrees, while the normal mean temperature for January is 24.2 degrees. It should be noted, however, that the mean temperature during January, 1940 was 18.5 degrees and in 1941 it was 21.2 degrees. The lowest temperature was -4 degrees on the 8th and the highest 42 degrees on the 31st. The domestic heating load was 1352 degreedays compared to a normal of 1255 degree-days. The total heating load for the season to the end of January is 3902 degree-days which is slightly more than 2 percent higher than the normal of 3817 degree-days for this period. The heating load for the current year to the end of January is 57 percent of the normal annual load.

There was a total snowfall of 19.25 inches during the month. The normal snowfall during January is 13.32 inches. The total precipitation during January is 3.61 inches. The mean humidity during the month was 73.3 percent compared to a normal of 70.1 percent. The total wind movement during the month was 4874 miles, the normal being 5055 miles. The highest wind velocity was 32 miles per hour on the 19th.

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to $19+2$.

## REMARKS

The weather during February was extreme in many respects. There was less snow than usual but alternate periods of warm and cold weather produced more icy walks than normal. The snowfall during the month was 5 inches, while the normal snowfall during February is 13.99 inches. Only three years since 1889 has there been less snow in February. The total precipitation during the month was 1.63 inches, the normal being 3.19 inches. The mean temperature for the month was 25.1 degrees compared to a normal of 23.7 degrees. The highest temperature was 58 degrees on the 23rd. This has been exceeded only three times since 1889. The lowest temperature was -23 degrees on the 16 th. This is the lowest temperature ever recorded at this station in February. Only twice have lower temperatures been recorded since 1889, -26 degrees in January 1904 and -23.5 in January 1907. The mean temperature on February 16 was - 13.5 degrees which is the lowest mean daily temperature recorded at this station. The domestic heating load for the month was 1117 degree-days, the normal for February being 1165 degree-days. The total heating load for the season to the end of February is 5019 degree-days. The normal for this period is 4982 degree-days. The heating load for the season is therefore less than one percent higher than normal. The total wind movement was 4672 miles, slightly less than normal, and the highest wind velocity was 35 miles per hour on the 15th. There were 199 hours of bright sunshine, the normal for February being 158 hours. The mean relative humidity was 71.3 percent compared to a normal of 66.6 percent.

The third column gives extremes observed from 1889 to 1942 .

## REMARKS

The weather during Miarch was somewhat colder than usual but near normal in other respects. The mean temperature for the month was 32.9 degrees while the normal for March is 34.4 degrees. The lowest temperature for the month was -7 degrees on March 9. Only once has there been a lower temperature in March since the station was established in 1889. A minimum of -7.5 degrees was recorded on Miarch 24 in 1906. The low temperature of -7 on March 9 this year was accompanied with the highest barometer ever recorded at this station, a reading of 31.05 inches, corrected to sea level. The domestic heating load for the month was 995 degree-days, the normal being 950 degree-days. The total heating load of the season to the end of March is 6014 degree-days compared to a normal of 5932 degree-days. The heating load to the end of March represents 88 percent of a normal year's total heating load.

The snowfoll during the month was 7.50 inches which is very near the normal snowfall for March. The total snowfall for the season is 38.75 inches while the normal snowfall to the end of March is 45.62 inches.

The total precipitation for the month was 3.07 inches, the normal being 3.70 inches. The total precipitation since January 1 is 8.31 inches. The normal precipitarion for that period is 10.50 inches. There were 220 hours of bright sunshine compared to a normal of 199 hours.

Dr. I. K. Shaw, research pomologist, makes the following statement regarding vegetation: "The minimum temperature of the past winter was unusually low. As a result we may look for more winter injury to fruit trees than usual. The peach fruit buds in Massachusetts were practically all destroyed. More or less browning of the wood indicates wood injury. We shall have to wait until growth starts to tell how severe this will be. The more tender varieties of apples also show wood injury, while the hardier varieties show little or none. How severe this may be, also remains to be seen. The covering of snow at the time of the severe cold should have prevented injury to roots and low-growing plants. A few warm days in the latter half of the month have caused some bud swelling in early leafing trees and shrubs, but the month closed with colder weather, checking the development of vegetation."

## REMARKS

The weather during April was very cold with a mean temperature of 41 degrees. This is the lowest mean temperature for April recorded at this station since it was established in 1889. The normal mean temperature for April is 45.7 degrees. The lowest temperature was 19 degrees which occurred on the 4th, 6th and 7th. This is not unusually cold for this month. The domestic heating load for the month was 721 degree-days compared to a normal of 579 degree-days. The total heating load for the season is now 6735 degree-days while the normal heating load to the end of April is 6511 degree-days.

The total precipitation during April was 3.66 inches; the normal precipitation is 3.35 inches. The snowfall was 1.75 inches, the normal being 2.17 inches. The total snowfall for the past winter was 33.50 inches. The normal snowfall to the end of April is 36.95 inches. There were 247 hours of bright sunshine compared to a normal of 220 hours. The total wind movement was 6200 miles, while the normal for April is 5404 miles. The highest wind velocity was 39 miles per hour on the 28th. A very low barometer of 28.98 inches, corrected to sea level, was recorded on the 14th. This is the lowest barometer recorded at this station in April.

Dr. Shaw comments as follows: "Rarely has a month of April passed with so little advance in vegetation as in April, 1943. Buds have enlarged and grass has become green at the close of the month, but the stage of development is at least two weeks behind that of the corresponding date of last year. There is as yet no indication of severe winter injury to fruit plants. There will be no peach crop in Massachusetts. There is some tree injury, but at present there is no indication that it will prove to be severe. The wood shows some brown discoloration and the branch tips are killed in some cases. Unless there is unseasonably warm weather in early May, blooming dates of all fruits will be later than the average. This is likely to make harvesting dates later than usual, but the danger of injury to blossoms and young fruits from spring frosts will be decreased. Apple fruit buds are swelling and indicate a light bloom which would be expected considering the heavy crop of last season."

## REMARKS

The outstanding feature of May weather was the large number of rainy days, with the rainfall considerably above normal. Rain fell on 15 days whereas the normal number of days of rain during May is 12. The total precipitation during the month was 5.62 inches, the normal for May being 3.60 inches. The total precipitation since January lst is 16.90 inches, while the normal for this period is 17.45 inches.

The mean temperature during the month was 57.8 degrees compared to a normal of 57.1 degrees. The highest temperature was 84 on the 17 th and the lowest temperature 31 on the 2nd. The domestic heating load during the month was 243 degree-days, while the normal for May is 267 . The total heating load for the winter season is 6978 degree-days and the normal for this period is 6778 degree-days.

There were 274 hours of bright sunshine, the normal for May being 252 hours. The total wind movement for the month was 4420 miles compared to the normal for May of 4504 miles. The highest wind velocity was 39 miles on the 17th. The last frost occurred on May 5. The normai date of last frost is May 14.

Dr. J. K. Shaw, research pomologist, makes the following statement on the progress of vegetation: "At apple blossom time, the season, as measured by the date of full bloom of the McIntosh apple, was two weeks later than those of 1941 and 1942. The progress of all vegetation has been delayed by cool weather and frequent rains. Planting has been delayed by bod weather and wet soils. Conditions have favored the development of apple scab and made control difficult. Peach bloom was entirely wanting in our orchards and nearly so in all northern peach areas. Peaches will be scarce this season. Apple bloom was light on trees that bore heavily last year. The apple crop will be less than the heavy crop of last year. Peach trees were more or less injured by the severe winter cold and other tender or half-hardy trees show some injury, but at present, no material loss of trees is indicated. There is an abundant water supply in the soil and if warm sunny weather comes soon, fruit trees will progress rapidly."

The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1942.

## REMARKS

The weather during June was unusually hot with less rain than normal. The mean temperature for the month was 71.1 degrees which is the highest mean temperature for June recorded at this station. The normal mean temperature is 65.7 degrees. The nine days of June 20th to June 28th had maximum temperatures in the nineties except for two days when the maximum was 86 and 88. The highest temperature was 95 degrees which occurred on the 26 th and 23 th. In spite of the high temperatures throughout the month, there were 8 days when the mean temperature was less than 65 degrees. The heating load for the month was accordingly 33 degree-days. This brings the total heating load for the season to 7011 degree-days. The normal heating load for the year is 6846 degree-days, so the past season was 2.4 percent colder than normal.

The rainfall during June was 2.38 inches compared to a normal of 3.75 inches. The total rainfall since January 1 is now 19.28 inches, the normal for this period being 21.20 inches. There was a total of $\fallingdotseq 56$ hours of bright sunshine compared to a normal of 257 hours.

Dr. J. K. Shaw, research pomologist, gives the following statement regarding vegetation: "The cool, wet weather of this spring came to an end for the last ten days of June and was succeeded by an unusually hot period with little or no rain. The sudden change to hot, sunny days caused shoots of succulent foliage to wilt and even show dry, dead areas. However, the injury is not enough to affect crops. Most fruit crops continued to make normal progress. The strawberry crop was a little late and below normal. Raspberries will also be light due to winter injury to the canes. The wet, cool spring favored a heavy hay crop and so far, harvesting weather has been favorable. Fruit trees show considerable wood injury from the severe cold of last winter, yet few have been entirely killed. The wood of peach trees in the nursery is almost completely dead, but most of the trees are growing vigorously. Evidently the cambium layer was not injured and plenty of rain enabled the trees to start a good recovery. The same is true of many varieties of sweet cherries, but recovery is not so good. While cold injury is rather more severe than usual, no great damage is yet apparent except for the loss of the peach crop."

## MONTHEY SUMMARY

Note-The forst colmm in the above swmary gives observations mate dubut the monh. The seconl culnma gives the : verages lasel on observations made irom 188 to 19.8 , excit that hemmdity records are based on observations made from 1929 to 19:8. The third colmm gives extremes observed from 1889 to $19+2$.

## REMARKS

July weather was slightly warmer than nomal, with heavy showers during the latter part of the month. The mean temperature for the month was 71.8 degrees compared to a normal of 70.8 for July. It will be recalled that the mean temperature for June was 71.1 degrees. The highest temperature during the month was 92 degrees on the 10th and the lowest, 43 on the 2 nd . The rainfall during the month was 6.18 inches while the normal for July is 4.10 inches. Only one other year since 1928 had greater rainfall in July. In 1938, 7.45 inches was recorded and in 1928, 6.23 inches. The total rainfall since January 1 is now 25.46 inches compared to a nomal of 25.30 inches for this period. There were 342 hours of bright sunshine during the month, while the normal for July is 268 hours. Twenty days classificd as "clear", nine as "fair" and two as "cloudy". Thunderstorms occurred on seven days.

Dr. J. K. Shaw of the Pomology Department makes the following report: "X'egctation made good progress during July. Dry wather during the early part of the month checked the progress of shallow-rooted plants, and excessively drained lawn soils showed dry, brown areas of grass. Frequent showers during the latter part of the month corrected this deficiency and the month closes with the soil well supplied with moisture. A hail storm did considerable damage to tolaceo and fruit crops in a limited area in Amherst.
"The strawberry crop was below normal and winter injury to raspherry canes has reduced the crop. The bluebery crop is about normal. Apple scal on unsprayed McIntosh is very severe owing to frequent rains while the foliage was expanding. It was well controiled on properly sprayed trees but there is likely to be more scalloy Mclintosh than usual."

Note-The first column in the above summary gives observations made during the month. The sccond column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 19.38 . The third column gives extremes observed from 1889 to $19+2$.

## REMARKS

The weather during August was very near normal in most respects. The rainfall was less than usual with a total precipitation of only 2.49 inches, while the normal for August is 4.08 inches. The total precipitation since January 1 is now 27.95 inches, the normal for that period being 29.38 inches. The mean temperature for the month was 68.9 degrees. The normal mean temperature for August is 68.6 degrees. There were 307 hours of bright sunshine which is well above the average, the normal for August being 237 hours. Wind travel was slightly less than usual, with only 2819 miles. No high winds were recorded.

Dr. J. K. Shaw, research pomologist, makes the following report on vegetation: "The weather during August was characterized by much cloudy, humid weather for the early part of the month. This resulted in some rotting and other disease injury to fruit and vegetable plants. The weather later in the month was less humid with many fair or clear days. The moisture supply continues ample. The appearance of dried out areas in lawns is one of the first signs of lack of rainfall. Except for a period in early July, lawns have presented a good appearance all summer. With the approach of shorter days and cooler weather and consequently a lessened demand for water by vegetation, there can be little damage from drouth this year. The apple crop is sizing and coloring fairly well, and the prospects are for a crop considerably below the unusually large crop of last year but not above the average of recent years."

Note-The first column in the abuve smmmary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third colmmn gives extremes observed from 1889 to $19+2$.

## REMARKS

The weather during September was slightly cooler than usual, with less precipitation than normal. The total precipitation for the month was only 2.40 inches, and half of this amount fell in one storm on the 15th. The normal for September is 4.26 inches. August also had less rainfall than normal, with 2.49 inches recorded during that month. The total rainfall since the first of the year is now 30.35 inches. The normal for this period is 33.62 inches.

The mean temperature for the month was 61.1 degrees compared to a normal of 61.7 degrees for September. The highest temperature was 91 degrees on the 7th and the lowest, 34 degrees on the 19th and 26 th.

The domestic heating load for the month was 163 degree-days. The normal for September is 149 degree-days.

There were 228 hours of bright sunshine compared to a normal of 201 hours for September. The total wind movement was 2867 miles, while the normal is 3271 miles. No high winds were recorded during the month.
Dr. Shaw's report on vegetation states: "The month of September is the final month of the season of vegetation. Perennial plants later go into the winter rest period. No general severe killing frost has occurred, but there was enough just after the middle of the month to partially or completely kill tender vegetation, the severity of injury depending on the location of the plants.
"The month has been dry. Coming so late in the growing season, it has not done much damage; but unless we have more abundant rains during the next two months, there will be a marked deficiency of soil moisture this winter.
'"The spring was late which, combined with heavy precipitation, delayed planting. No severe drouth periods have occurred. The season has, on the whole, been quite favorable to most crops."

## REMARKS

October was slightly warmer than usual, with more precipitation than normal. There were many pleasant days the first part of the month. The dry spell which prevailed in September continued until the 15 th of October, and only half an inch of rain was recorded during the period from September 15 to October 15. However, heavy rains during the latter part of the month brought the total rainfall for October to 3.88 inches. The normal for October is 3.29 inches. The total rainfall since the first of the year is now 34.23 inches, which is 2.68 inches less than normal for this period.

The mean temperature for the month was 51.4 degrees, which is .9 degree warmer than normal. The highest temperature was 80 degrees on the 9th, and the lowest, 23 on the 11th.

The domestic heating load for October was 422 degree-days, and the total load for September and October is 585 degree-days. The normal heating load for September and October is 605 degree-days.

The first killing frost was late this year, October 6 being the date at this station. The normal date for first frost is September 21 and last year it occurred on September 29.

There was less sunshine and more wind than normal.

## REMARKS

November had more rain and snow than usual, although the month as a whole was normal. As in October, there were many pleasant days during the month and the fall season has been an enjoyable one in most respects. 'The first snow of the season occurred on November 15, although a light trace was recorded on the llth. The normal date for tirst snowfall is November 6, and last year only a trace was recorded in November. The snowstorm on the 22 nd and 23 rd, in which 4 inches was recorded at Amherst, was accompanied by high winds and although the storm was not considered too severe in this section, in many parts of New England it developed into one of the worst storms of the season in many years. The total snowfall for the month was 5.00 inches and the precipitation, 4.54 inches. The normal snowfall for November is 2.34 inches and the normal precipitation, 3.41 inches.

The mean temperature for the month was 38.7 degrees, while the normal for November is 38.9. Last year the mean was 38.8 degrees. The domestic heating load was 788 degree-days for November, and the normal for this month is 784 degree-days. The total load for the season through November 30 is 1373 degreedays compared to a normal of 1389 for this period.

There were 148 hours of bright sunshine for November, while the normal for this month is 121 hours.

Sleet fell on the 15th, and the roads were icy on the 2lst, 22nd and 23 rd.

The third colmm gives extremes observed from 1889 to 194.3.

## REMARKS

The weather during January was somewhat warmer than usual with very little snow. The mean temperature for the month was 26.7 degrees, while the normal for January is 24.2 degrees. The temperature dropped below zero on one day, the 17th, when the thermometer reached 2 below zero. The heating load during January was 1186 degree-days whereas the normal for this month is 1265 degree-days. The total heating load for the season to the end of January is 3803 degree-days, the normal for this period being 3817 degree-days.

The snowfall during the month was 5.75 inches, while usually we get 13.32 inches during January. The total precipitation for the month was only 1.24 inches, the normal being 3.61 inches. The total snowfall for the winter to the end of January is 10.75 inches, the normal for the period being 24.16 inches. There were 187 hours of bright sunshine compared to a normal of 137 hours. Total wind movement was only 3914 miles, while the normal wind movement for January is 5055 miles. The highest wind velocity was 30 miles per hour on the 30 th. The mean relative humidity was 70 percent.

## REMARKS

The weather during February was unusually pleasant. The temperature was not as low as usual, there was less rain and snow than normal, and a greater amount of sunshine than usual was recorded. Roads were unusually free from ice.

The mean temperature for the month was 25.9 degrees, the normal being 23.7 degrees. The lowest temperature was -5 degrees, the normal minimum for February being -7.4 degrees. It is interesting to recall that the temperature fell to -23 degrees on February 16 in 1943. The heating load for the month was 1134 degree-days, the normal being 1165 degree-days. The total heating load for the season to the end of February is 4937 degreedays, while the normal for that period is 4982 degree-days.

Only 7.50 inches of snow fell during the month while the normal snowfall for February is 13.99 inches. The total precipitation was 2.34 inches compared to a normal of 3.19 inches. The total snowfall for the winter is now 18.25 inches, while usually we get 38.15 inches to the end of February. There were 170 hours of bright sunshine during February compared to a normal of 158 hours. The mean relative humidity was 66.2 percent, the normal is 66.6 percent. The maximum wind velocity was 48 miles per hour on the 15 th.

Note-The first enlum in the above smmary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third colmm gives extremes observed from 1889 to 1943.

## REMARKS

The weather during March was nearly normal in most respects. It was slightly colder than usual and there was more rain and more sunshine than normal. The mean temperature for the month was 32 degrees, the normal being 34.4 degrees. The lowest temperature was 5 degrees on the 5th. The normal minimum for March is 6.1 degrees. The domestic heating load for the month was 1022 degree-days compared to a normal of 950 degree-days. The heating load for the season to the end of March is 5959 de-'gree-days, the normal for this period being 5932 degree-days.

The total precipitation for the month was 4.36 inches, with 8.25 inches of snow. The normal precipitation for March is 3.70 inches and the normal snowfall 7.47 inches. The total precipitation since January 1 is 7.94 inches, while the normal for the three months is 10.50 inches. We have had a total of 26.50 inches of snow during the winter, the normal snowfall to the end of March being 45.62 inches.

There were 226 hours of bright sunshine, the normal being 199 hours. The highest wind velocity was 40 miles per hour on the 28th.

Dr. J. K. Shaw, research pomologist, makes the following statement: "There has been no severe cold during the past winter but snowfall was deficient and the ground bare most of the time. We should look for no material winter injury to tree fruits and few peach fruit buds have been killed. Therefore, a good peach crop is to be expected as spring frosts rarely kill the flowers or young fruits in Massachusetts. The absence of a snow cover is not good for strawberry plants but well-mulched beds should not suffer. The present state of vegetation is somewhat retarded, and we do not expect an early spring. Resumption of growth depends on future rather than past temperatures and a few days of warm weather will bring a normal stage of progress."

## REMARKS

The weather during April was cold with a mean temperature of 42.9 degrees. The normal mean temperature for April is 45.7 degrees. The lowest temperature was 23 degrees on the 4th and the highest, 74 degrees on the 30th. The domestic heating load for April was 664 degree-days compared to the normal of 579 degree-days. The total heating load for the season is now 6623 degree-days while the normal heating load to the end of April is 6511 degree-days.

The total precipitation during April was 3.66 inches. There was no snowfall. Normal precipitation for April is 3.35 inches; normal snowfall, 2.17 inches. The total snowfall for the winter was 23.50 inches compared to the normal of 47.79 inches. Last winter's snowfall was 40.50 inches. There were 220 hours of sunshine. The normal is also 220 hours. The total wind movement was 4306 miles, while the normal is 5404 miles.

Dr. J. K. Shaw makes the following comments: "Vegetation made slow progress during April because of much cold weather. The month closes with early leafing trees showing only tiny leaves just breaking from the bud. Apple buds have not shown any color. The season is a week or more later than average. The rainfall will help to restore the depleted water reserves of the soil, and the later the buds break the less danger from spring frosts. Severe winter injury has become apparent in blueberry plants, and raspberry canes have been injured. No winter injury to tree fruits is yet apparent, and we can feel quite confident that none will appear. Apple and peach fruit buds are evident and there is promise of a heavy bloom. Some evergreen trees show winter injury. The ground froze deeply and was hardly completely thawed out at the end of the month. This condition toqether with winds may have been factors in causing winter injury. Except for late planting, the crop season of 1944 starts off fairly well."

## REMARKS

May of this year was the warmest, sunniest and very nearly the dryest May on record here at the station; and yet on the morning of the 19th a killing frost occurred which caused serious damage to crops in this section.

The mean temperature for the month was 63.4 degrees, compared to a normal of 57.1 degrees. This is the highest mean temperature for May recorded at this station in 56 years. The nearest approach to this record is a mean temperature of 62.5 degrees recorded in 1911. The highest temperature was 93 degrees on the 31st and the lowest, 30 degrees on the 19th. The first and last weeks of the month were exceptionally warm. The domestic heaing load for the month was 112 degree-days, the normal for May being $2 \circ 7$ degree-days. The total heating load for the season to the end of May is 6735 degree-days while the normal for this period is 6778 degree-days.

The total precipitation for the month was 1.35 inches, which is 2.25 inches less than normal for May. Rain fell on only four days. The total precipitation since the first of the year is now 12.95 inches, while the normal for this period is 17.45 inches. The outstanding feature of May weather last year was the large number of rainy days, 15 in all, with a total rainfall of 5.62 inches.

There were 350 hours of bright sunshine compared with $\alpha$ normal of 199 hours. There were no high winds during the month.
Dr. J. K. Shaw, research pomologist, makes the following interesting comments regarding the progress of vegetation: "At the end of April the development of vegetation was a week or more behind normal. During the first half of May there were many days when the temperature was unusually high and the date of bloom of fruit plants was two or three days earlier than normal. Warm weather continued through the blooming period, bees were active and prospects were for a heavy set of fruit. Both apples and peaches blossomed heavily. On May 17 the maximum temperature was 85 degrees. On the afternoon of the 18th the temperature rose to 58 degrees and then fell to a minimum of 30 degrees on the morning of the 19th. This caused severe damage to tree fruits and injured tender vegetation. Orchards on high sites with good air drainage apparently escaped injury but those on low sites or in "frost pockets" suffered complete loss of the setting fruits. Some soft, tender new shoot tips were killed and there was injury to all tender vegetation that had been encouraged by the warm days preceding May 18. This is the second time in 37 years that there has been extensive spring frost injury in our orcherds. Rainfall during the month was deficient. While the month closes with no serious drouth injury, shallow-rooted plants will soon suffer if roins do not come early in June."

## REMARKS

The weather during June was near normal in all respects. The mean temperature for the month was 66.3 degrees which is only 0.6 of a degree higher than normal. The highest temperature was 95 degrees on the 29th and the lowest 40 degrees on the 8th. The domestic heating load during the month was 64 degree-days which is 4 less than normal. The domestic heating load for the 1943-44 season was 6799 degree-days while the normal is 6846 degree-days.

The total precipitation for the month was 4.70 inches, the normal for June being 3.75 inches. The total precipitation since January 1 is now 17.65 inches, while the normal for this period is 21.20 inches. There were 279 hours of bright sunshine compared to a normal of 257 hours. The mean relative humidity was 70.8 percent, the normal being 66.9 percent. The highest wind velocity was 39 miles per hour on the l6th.

Dr. J. K. Shaw gives the following report: '"The dry period of May continued into June. Light rains on June 7th, 10th and 18th kept matters from growing worse, and during the period from June 19 to June 24 , abundant rains removed any danger of drought injury for some time to come. The dry weather delayed germination of newly-planted seeds and plant setting, and injured shallow-rooted plants. The early hay crop was very short. The heavy rains came in season to increase growth of later fields and encourage a better second crop. Tree fruits did not suffer from lack of water.
"Further reports of the frost of May 19 indicate serious losses of the apple crop. Injury was confined to low frosty locations, while orchards on higher sites escaped any injury. Other tree fruits seem to have suffered but little. The crop of cultivated blueberries was very seriously injured and strawberries were extremely scarce."

## REMARKS

The weather during July was warmer than usual, with more sunshine and less wind than normal. Eight heavy thunderstorms during the month brought much needed rainfall.

The mean temperature for the month was 72.9 degrees, the normal for July being 70.8 degrees. The highest temperature was 93 degrees on the 8 th and 9 th, and the lowest 50 degrees on the 22nd. A 21 -day period beginning June 26 and ending July 16, when the maximum temperatures were in the 80's and 90's every day without a break, made a rather uncomfortable warm spell. In 1911 there was a 29-day period when the daily maximum temperatures, with the exception of one day, ranged from 80 degrees to 104 degrees. On three consecutive days during that period the afternoon temperatures reached $102.5,104$, and 101.5 degrees respectively. Other warm Julys were recorded in 1921 and 1935.

The total precipitation was 3.88 inches, compared with the normal for July of 4.10 inches. The total precipitation since the first of the year is now 21.53 inches, while the normal for this period is 25.30 inches.

There were 335 hours of sunshine, the normal being 268 hours. The total wind movement was 2747 miles as compared to the normal for July of 3422 miles.

Dr. Shaw makes the following comments: "The progress of vegetation during July was about normal. There were hot periods and, at times, lack of rain threatened to cause drought conditions. However, timely showers relieved the situation, and the month closed with enough moisture in the soil to maintain normal growth of crops for a week or more. Early varieties of apples matured somewhat earlier than normal. Hail on July 30 damaged crops a little to the north of us. The hay crop was generally small and there has not yet been enough rain to grow a very heavy second crop."

* Based on least time reguired to blow one mile.

Fernand E. Bartlett, Observer

Note-The first column in the above summary gives observations made during the month. The second column gives the averages hased on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third colmm gives extremes observed from 1889 to 1943.

## REMARKS

The weather during August was marked with several extremes. The first three weeks were very warm with 10 days on which the temperature exceeded 90 degrees, the hottest being 99 degrees on August 12. This has been exceeded only once in August in the history of this station. This was in 1918 when the maximum temperature was 100 degrees. The weather cooled off during the last week in August so that the mean temperature for the month was 72.4 degrees. This has been exceeded only twice since 1889; in 1937 when the mean for August was 73.3 degrees and 1939 when it was 73.5 degrees. The mean temperature for the three summer months of the past season was 70.5 degrees. This equals the previous record for hot summer months which was reached in 1939.

The rainfall during the month was 4.33 inches. Of this amount 2.18 inches fell on the afternoon of the 14th. During part of this storm rain fell at a greater intensity than had previously been recorded at this station. A total of 2.02 inches fell in one-half hour and 1.10 inches fell in 10 minutes. The rain on the 14th was followed by another heavy rain on the 17th when 1.72 inches fell. There were 301 hours of bright sunshine, the normal being 237 hours. The mean relative humidity for the month was 70.8 percent. The highest wind velocity was 36 miles per hour on the 14th.

Dr. J. K. Shaw makes the following comments: "The weather during August was characterized by extremely hot periods and it was on the dry side much of the time. The month closes with the soil pretty dry. Timely rains broke the drought before disastrous results took place but many crops suffered injury. Fruit plants stood the dry weather with little injury; and apples, peaches, and other fruits are sizing and coloring well. Except in orchards on low, frosty sites, where the freeze of May 19 was disastrous, all tree fruits promise good crops of excellent fruit."

## REMARKS

The hurricane on the 14th and 15th was the outstanding feature of the weather during September. The storm was much less severe in Amherst than the hurricane of 1938 and comparatively little damage was done in this section. The highest wind velocity was 55 miles per hour at 10:45 P. M. (E. S. T.) on the 14th. The direction ranged from north to northeast. The barometer reached its lowest reading of 29.13 inches at 10:30 P. M. The total rainfall from the 12th to the 15th was 3.76 inches.

The mean temperature during the month was 63 degrees while the normal mean temperature for September is 61.7 degrees. The lowest temperature was 33 degrees on the 24 th. There were no killing frosts during the month, although there were light frosts on low ground on the 24th cind 25th. The domestic heating load during the month wc:s 122 degree-days compared to a normal of 149 degree-days in September.

The rain fall during the month was 5.31 inches, the normal being 4.24 inches. The total precipitation since January 1 is 31.17 inches, while the normal precipitation for this period is 33.62 inches. There were 207 hours of bright sunshine which is 6 hours more than normal for September.

Dr. J. K. Shaw, research pomologist, makes the following comment: "While the hurricane on September 14 was by no means so severe as that of 1938, it ruined some shade and orchard trees and blew off from 20 to 50 percent of the McIntosh apples remaining on the trees. Later varieties suffered less but some of these fell. The taller farm crops still in the field were injured. Corn fields were much disturbed. Hurricane damage was worse in the eastern part of the state where a loss up to 75 percent of the McIntosh still on the trees was reported. Otherwise, the progress of vegetation was about normal. Most fruits ripened a little earlier than usual, perhaps due to abnormally warm weather during the summer."

＊Based on least time required to blow one mile．
Fernand E．Bartlett，Observer

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations nade from 1889 to 1938 , except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1943.

## REMARKS

The weather during October was dry and clear, with the temperature very near normal. Rain fell on only five days, with a total fall of 1.74 inches, whereas the normal for October is 3.29 inches. The rainfall during the past three months-August, September and October-was 11.38 inches, while the normal rainfall for this period is 11.61 inches. There were 225 hours of bright sunshine compared to a normal of 175 hours.

The mean temperature for the month was 50.0 degrees. The normal mean temperature for October is 50.5 degrees. The highest temperature was 85 degrees on the 7th and the lowest, 24 degrees on the 31st. The domestic heating load was 472 degreedays, the normal for October being 456 degree-days. The total heating load for September and October this year was 594 degreedays, while the normal for these two months is 605 degree-days.

The total wind travel during the month was 4396 miles, the normal for October being 4074 miles. A maximum velocity of 32 miles per hour was recorded on the 29th.

The mean relative humidity was 71.6 percent, while the normal for October is 69.0 percent.

Correction: A typographical error on page 3 in the September bulletin gives September 21 as the date of the first frost in 1944. There was no frost at this station in September. The date "September 21 " should appear in the "Normal" column.

## REMARKS

The weather during November was near normal in most respects. The mean temperature for the month was 39 degrees which is one tenth of a degree higher than normal. The highest temperature was 68 degrees on the 3rd and the lowest was 19 on the 24th. The normal minimum for November is 12.9 degrees. In 1938 the temperature dropped to -4 degrees in November. The domestic heating load for November was 782 degree-days compared to a normal of 784 degree-days. The lotal heating load for the season to the end of November is 1376 degree-days, while the normal for the period is 1389 . This represents 20 percent of the normal year's heating load.

The total precipitaiion during the month was 4.21 inches. Of this amount, 1.73 inches fell during the storm on the 29th and 30th. This storm which was quite severe on the coast gave only moderate wind velocities at this station. The highest velocity recorded was 28 miles per hour. It was accompanied with a very lowr barometer. The minimum was 28.87 inches on the 30th. The normol precipitation for November is 2.41 inches. The first snow of the season fell on November 0 when 0.25 of an inch fell. This is the normal date for the first snow. Acain on the 18th, 0.50 of an inch of snow fell. The normal sno wril fo November is 2 ? inchas. There were 127 hours of beight conshine the nom 1 being 121 hours. The mean relative humidity was 75.8 percert. while the normal for Novembe: is 70.3 perant.

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, excent that humidity records are based on observations made from 1929 to 1938 . The third column gives extremes observed from 1889 to $19+4$.

## REMARKS

January produced severe winter weather. The mean temperature was 17.8 degrees which is the coldest January since 1920. In that year the mean temperature in January was 15.2 degrees. In only four other years since this station was established in 1889 has January been colder than the present year On six days the temperature dropped below zero and on only 8 days was the maximum above 32 degrees. The lowest temperature was - 10 degrees on the 25th. The heating load was 1462 de-gree-days whereas the normal for January is 1265 degree-days. The total heating load for the season to the end of January is 4070 degree-days, the normal being 3817 degree-days. The heating load for the season to the end of January is nearly 7 percent higher than normal.

The snowfall during the month was 23.50 inches compared to a normal of 13.32 inches. The snowfall for the winter is 33.50 inches; the normal to the end of January is 24.16 inches. The heavy snowfall in January was equalled in 1904 and has been exceeded only 3 times since 1889. The total precipitation was 3.07 inches, the normal being 3.61 inches. There were 177 hours of bright sunshine, the normal being 137 hours. The highest wind velocity was 45 miles per hour on the 24th.

## REMARKS

The weather during February was warmer than normal with a mean temperature of 25.7 degrees. The normal for February is 23.7 degrees. It was quite cold during the first week of the month, about normal for two weeks, and then warmer than normal during the last week. The mean temperature for the three winter months of December, January, and February was 22.9 degrees while the normal for that period is 25.1 degrees. The domestic heating load for the month was 1100 degree-days, making the total for the season 5170 degree-days. The normal for February is 1165 degree-days and for the season to the end of February the normal is 4982 degree-days. The heating load to the end of February is therefore about 4 percent higher than normal. The snowfall during the month was 16.50 inches compared to a normal of 13.99 inches. The snowfall for the winter is now 50.00 inches, the normal for the period being 38.15 inches. The total precipitation for the month was 3.33 inches. The normal for February is 3.19 inches.

There were 171 hours of bright sunshine, the normal being 158 hours. Total wind movement was 4277 miles while the normal wind travel for February is 4776 miles. The maximum wind velocity was 32 miles per hour on the 24th. The prevailing direction was west. Mean relative humidity was 67.5 percent, the normal being 66.6 percent.

The third column gives extremes observed from 1850 to 1944.

## REMARKS

Weather during March was abnormally warm, with less rain and snow than usual. The mean temperature during the month was 44.4 degrees, while the normal mean temperature for March is 34.4 degrees. This is the highest mean temperature ever recorded for March at Amherst since 1837. The maximum temperature of 85 degrees on March 29 is the highest reading ever recorded in March. The heating load during the month was 645 degree-days, the normal being 950 degree-days. The heating load for the season is now 5815 degree-days whereas the normal for that period is 5932 degree-days.

A total of 2.50 inches of snow fell during the month and the total precipitation was 2.16 inches. Normally we get 7.47 inches of snow in March with a total precipitation of 3.70 inches. The total snowfall for the winter to the end of March is 52.50 inches, the normal being 47.78 inches. There were 226 hours of bright sunshine, the normal for March being 199 hours.

Dr. J. K. Shaw, research pomologist, gives the following report: "While the past winter was colder than the average, there were no severe minima, and peach fruit buds survived the winter in numbers sufficient for a good crop. The heavy covering of snow protected low-growing plants and the ground thawed from below so that there was little frost in the ground when the snow cover melted. This took place in March with unusual rapidity but with no high river floods. The extremely high temperatures in March have advanced vegetation so that it is about as far along as it was a month later last year. Grass is green and leaves are developing on many shrubs. Forsythia is in full bloom at the last of the month. It is, so far, the earliest spring in many years.

## REMARKS

The warm weather which started in March continued through the first half of April but the latter half of the month has been near normal. The mean temperature for the month, however, was 51.8 degrees which is 6.8 degrees higher than normal. The high mean temperature of 51.8 degrees has been exceeded only once in April since 1889; that was in 1941 when the mean was 52.1 degrees. The highest temperature was 86 degrees on the 13th. The lowest temperature was 26 degrees on the 23 rd, causing general damage to the fruit crop.

The domestic heating load was 406 degree-days compared to a normal of 579 degree-days. The heating load for the season to the end of April is 6221 degree-days, the normal for that period being 6511 degree-days.

The rainfall during the month was 5.43 inches with no snow. The normal precipitation for April is 3.35 inches with 2.17 inches of snow. There were 258 hours of bright sunshine which is 38 hours more than normal.

Dr. J. K. Shaw makes the following report on the progress of vegetation: "The fear of cold injury expressed last month proved well founded. Temperatures appropriate to March came along in April and there has been severe damage to fruit crops. Apple bloom was not as heavy as expected but there was enough for a good crop. We had a narrow escape on April 6 and 7 when temperatures approached the danger point but caused little if any injury. Then on the morning of April 23 there was severe and widespread damage. There was less difference in orchards on different elevations than there was from the freeze of May 19, 1944. Injury was more general and more severe. From 80 to 90 percent of the flowers on all tree fruits in our orchards were killed. This seems to include all that were open at the time. Some of the unopened buds were killed and others survive. Ordinarily such buds do not produce much good fruit but being relieved of the competition from the earlier opening flowers they may mature good fruits. The continued low temperatures that prevailed through April are unfavorable to bee flight and to fertilization of the blossoms. From one to three weeks must pass before we can tell how many of these flowers will produce fruits. The little embryonic peaches have not swelled following bloom as they usually do. This may be only a delay due to continued cold weather or they may be ruined. In some parts of this state more injury is reported to have occurred on April 24 but in Amherst the temperature was about $4^{\circ}$ higher and little if any additional injury took place. Apparently in Amherst orchards as much or more than in any other section of the state there is still a danger period of 2 or 3 weeks ahead of us.
"Open strawberry flowers were killed but these were too few to materially affect the crop. No distinct injury to bush fruits and grapes has yet been determined.
"The apple blossom period was the earliest and most prolonged of any in the past 40 or more years and fully three weeks ahead of normal. Last year the blooming period of all tree fruits lasted scarcely over a week; this year it has continued for nearly a month and some apple blossoms had not opened at the end of April.
'Two successive years of cold damage to fruits has never before occurred in Massachusetts within the memory of the present generation. There may be a good many bushels of apples and other tree fruits in Massachusetts in 1945 but the crop must be reduced 50 percent and probably more--perhaps much more."

The third column gives extremes ohserved from 1889 to 1944

## REMARKS

The weather during May was cold and wet, delaying planting and in general producing a late spring in spite of the warm weather in late March and early April. The mean temperature for May was 54.1 degrees, the normal mean being 57.1 degrees. This is the coldest May since 1927 and in only five years has there been a colder May since this station was established in 1889. The lowest temperature was 31 degrees on the 1lth. This was the last frost at the observatory although there were frosts on low ground in Amherst on the 25th. The heating load for May was 338 degree-days, the normal being 267 degree-days. The total heating load for the season is now 6559 degree-days, the normal to the end of May being 6778 degree-days.

The rainfall for the month was 6.45 inches compared to a normal of 3.60 inches. Rain fell on 20 days during the month. This heavy rainfall in May has been exceeded only twice since 1889, the last being in 1931 when 7.44 inches fell. An inch of snow fell on the 10th and llth. There were 190 hours of bright sunshine, the normal for May being 252 hours.

Dr. J. K. Shaw reports on the progress of vegetation as follows: "'The weather during May continued cool with an excess of rainfall. These conditions assure a good hay crop but were not very favorable for fruit. Yet the blossoms not killed by the April freeze set rather well so that a small and spotty crop is in sight. Prospects are better than was feared a month ago. Plums are very light but pears and peaches seem to have set good crops. The apple crop over the state is variable, some orchards having a good prospect of a crop and in others a total failure is indicated. Of course, many orchards are between these extremes. The common estimate of half a crop seems reasonable. Frequent rainy periods have favored apple scab infection so that ozchards not thoroughly sprayed may produce many scabby apples. Those well sprayed at proper times are quite free from scab. While frost killed the very early strawberry blossoms, conditions so far have favored a good crop from the limited plantings made last year. The soil is now well supplied with moisture, and if dry, sunny weather prevails during the ripening period, a good crop should be harvested. The month closes with a cold night, reminding us that it is still possible to have further frost injury."

## REMARKS

The outstanding feature of June weather was the excessive rainfall. Rain fell on 17 days with a total of 7.67 inches. This rainfall for June has been exceeded only three times since the station was established in 1889: In June 1903 with a rainfall of 7.79 inches, in 1922 with 9.68 inches, and in 1938 with 8.45 inches. Only once was this June rainfall exceeded during the period from 1836 to 1888. In 1862 the June rainfall in Amherst was 11.69 inches. The normal rainfall for June is 3.75 inches. The normal total rainfall for April, May and June is 10.70 inches. This year the rainfall for these three months is 19.55 inches. This has never been reached since records have been taken since 1836. Normally rain falls on 34 days during the three spring months. This year rain fell on 46 days.

The mean temperature for the month was 66.1 degrees, the normal being 65.7 degrees. The highest temperature was 92 degrees on the 15th and 30th. The lowest temperature was 37 degrees on the 1st and 7th. The heating load during the month was 105 degree-days compared to a normal of 68 degree-days. This brings the total heating load for the season to 6664 degreedays, the normal being 6846 degree-days. The heating load for the season was therefore slightly less than 3 percent below normal. There were 242 hours of bright sunshine compared to a normal of 257 hours.

Dr. J. K. Shaw makes the following statement: "Excessive rainfall continued through June but with a change to hot, humid weather. The hay crop is heavy but frequent rains have delayed harvest and injured quality. Peaches and pears have set a good crop, but a severe local hailstorm on the afternoon of June 15 caused injury and broke a large percentage of our greenhouse glass, although there was little or no hail damage a mile or two away. The strawberry crop was good but suffered from rot because of wet weather. The raspberry crop will be good but blueberries will be short. Some varieties of apples set well from late bloom in spite of April freezes but, in our own orchards, suffered from hail damage. McIntosh, our main variety, failed to set well from the uninjured blossoms and the crop will be very small. Few of our mature trees will yield a bushel each. The apple crop in this vicinity will be the smallest in many years and of poor quality because of scab, frost russeting, and, in our own orchards, hail damage. Last month's estimate of half a crop was over optimistic, largely because of a poor set of McIntosh. Present indications suggest a quarter of a crop is a more reasonable expectation."

## REMARKS

The outstanding feature of July weather was the continuation of the heavy rainfall which started in April. Rain fell on 16 days in July and the total was 7.36 inches as compared to a normal of 4.10 inches. This heavy rainfall has been exceeded only three times in July since 1889: 10.52 inches fell in 1889; 14.51 in 1897, and 9.13 in 1915. Much of the rain occurred as heavy showers. The total rainfall since April 1 is now 26.91 inches, the normal for this period being 14.80 inches. The heavy rainfall has been disastrous for many crops and has made haying particularly difficult.

The mean temperature for the month was 70.6 degrees which is only 0.2 of a degree less than normal. In spite of the frequent rains, we had 275 hours of bright sunshine while the normal for July is 268 hours. There were no high winds and the average humidity was 73.1 percent.

Professor J. S. Bailey of the Department of Pomology makes the following comments: "July has been another month of hot, humid weather and excessive rainfall. A prospective good raspberry crop turned out to be very light because so many berries became too soft or molded on the bushes. The blueberry crop, buth cultivated and wild, has been cut heavily by mummy berry disease. Apple scab has been the worst in years. McIntosh orchards that were not frequently and thoroughly sprayed are heavily infected. Scab carryover for next year will be heavy.
"Light crops and abundant water have resulted in rapid sizing of fruit with prospects of many oversized apples of poor keeping quality. Several very heavy rains have increased the difficulty of insect control by washing off arsenical sprays. Severe erosion during the heavy rains re-emphasizes the need for erosion control in many places. Late blight of potatoes appeared early and is very severe in many Comnecticut Valley fields. Many other diseases of both fruits and vegetables have been unusually severe."

## REMARKS

The weather during August was near normal in most respects. The mean temperature was 58.3 degrees, the normal being 68.8 degrees. The rainfall was less than normal. The total rainfall was 2.79 inches, the normal being 4.08 inches. There were 263 hours of bright sunshine as compared to a normal of 237 hours. The mean relative humidity was 72.6 percent, the normal being 70.2 percent. There were no high winds.

The following report is given by Dr. J. K. Shaw: "The excessive rainfall which has prevailed since spring came to an end with August, but the soil is still well supplied with water and we can be quite sure that the summer of 1945 will be one with no injury from dry weather. Hot, humid periods interspersed with cool weather prevailed during the month. The weather has been bad for potatoes for the vines grew well during the wet weather and were unable to stand the hot, sunny weather which followed. Consequently, we may expect a poor crop in this vicinity.
"The apple crop will be the smallest in many years, and of very poor quality in the College orchards because of injury by hail. Apple scab is more prevalent than usual because of 'scab weather' and the faci that many growers did not spray as thoroughly as usual on account of the lack of a crop. The peach crop is good both here and over the whole country. Pears will make a fair crop but plums are few.

Plenty of rain insured a good second crop of hay, which should be plentiful next winter although much of it will be of poor quality owing to wet weather which delayed harvest."

Dr. A. B. Beaumont makes the following comments on clovers: "This has been one of the best 'clover' years observed by local agronomists. Tame and wild clovers have grown luxuriantly. Red and alsike clovers have been abundant in new hay seedings, and red clover has reappeared in many old mowings. The rowen crop now being harvested contains a high proportion of clovers. Wild white clover and the giant white cultivated clover (Ladino) have grown especially well in fertilized pastures. Sweet clover and rabbit-foot clover have been much in evidence along roadsides and in waste places. Abundant rains during the early part of the season are thought to have been responsible for the abundance of clovers this year."

## REMARKS

The weather during the month of September was very pleasant, with higher temperatures than normal and slightly less rainfall. The total precipitation for the month was 3.57 inches, while the normal for September is 4.24 inches. The mean temperature was 64.6 degrees, the normal for September being 61.7 degrees. The highest temperature was 91 degrees on the 7th and 8th and the lowest, 36 degrees on the 30 th. There has, therefore, been no frost in September this year. The normal date for the first frost is September 21st. The domestic heating load for the month was 110 degree-days compared to a normal of 149 degree-days. There were 174 hours of bright sunshine compared to a normal of 201 hours. There were no very high winds during the month, the highest being 28 miles per hour on the 21st.

Dr. J. K. Shaw makes the following comments: 'Cool weather interspersed with hot, humid periods characterized the weather of September. The McIntosh apple harvest was completed. Not only was the crop the smallest in many years, but the quality was poor owing to unusual prevalence of scab in some orchards. Other later varieties are partially harvested. A few, mostly the later blooming varieties, will yield good crops, but the total crop in Massachusetts will not greatly exceed one-fourth of a normal crop. It will be less than that in this immediate vicinity. Probably the short McIntosh crop is due as much to cold, wet weather following bloom as to the spring frost during the remarkably early blooming period. These conditions interfered with adequate fertilization of the flowers. Enough McIntosh blossoms survived the frost to make a fair crop in many orchards if fertilization had been effective. Other tree fruits matured fair to good crops. The potato crop in this vicinity will be poor owing to the wet spring and unfavorable weather in August. The onion crop in the Valley is considerably below average."

## REMARKS

The weather was near normal in most respects during October. The mean temperature for the month was 49.5 degrees, the normal for October being 50.5 degrees. The highest temperature was 81 degrees on the 19th. The lowest was 25 degrees on the 4th, which is the first frost of the season. The normal date for the first frost is September 21st. The heating load during October was 482 degree-days, the normal for October being 456 degree-days.

The total rainfall during the month was 2.18 inches. Normal precipitation for October is 3.29 inches. The total precipitation since January l to the end of October is 44.01 inches which is 7.10 inches above normal. There were only 139 hours of bright sunshine during the month compared to a normal of 175 hours. There were high winds on the 3rd and 27th, with a maximum of 39 miles per hour on the 3rd.

Dr. J. K. Shaw states: "The month of October concludes the crop season of 1945. The summer was unusual in some respects. It was unseasonably warm in March and early April. Then came cold nights with seriously damaging frosts and generally cool weather that counteracted the effect of the early warm weather. The season as a whole was wet, especially in May; there were few, if any, periods when crops or lawns suffered from drought. These conditions favored injury from many fungus diseases, but there was a bumper hay crop. Apple scab was prevalent because the spring frosts and ensuing cool weather resulted in the smallest apple crop in many years, and many growers thought it not worth while to spray their orchards.
"Conditions that injure some crops are favorable for others. On the whole, the season of 1945 was neither bad nor especially good."

## REMARKS

November weather was near normal in most respects. The snowstorm on the 29th was not very severe at Amherst, with a fall of only 3 inches, but was a severe storm in the eastern part of the state. It was the first snow of the season. It was the latest date for the first snow since the station was established. The normal date for the first snow is November 6 and the normal snowfall in November is 2.34 inches. The total precipitation for the month was 3.54 inches, normal being 3.41 inches. The mean temperature for the month was 40.3 degrees whereas the normal mean temperature for the month was 16 degrees on the 27th. The domestic heating load for the month was 740 degree-days, normal being 784 degree-days. The total heating load to the end of November is 1332 degree-days. The normal heating load through September, October, and November is 1389 degree-days. There were 95 hours of bright sunshine compared to a normal of 121 hours. There were no high winds, the highest velocity being 32 miles per hour on the 15 th. The mean relative humidity was 76 percent, the normal being 70.6 percent.

## REMARKS

The weather during January was slightly colder than normal and there was more snow than usual. The mean temperature was 23.2 degrees while the normal mean temperature for January is 24.2 degrees. The lowest temperature was -8 degrees on the 28th and the highest, 50 degrees on the 6th. The average minimum temperature in January is -7.1 degrees. The domestic heating load for the month was 1296 degree-days as compared to a normal of 1265 degree-days. The heating load for the season to the end of January is 3952 degree-days, the normal for this period being 3817 degree-days.

The total snowfall for the month was 20.3 inches. Usually we get 13.32 inches of snow in January. The total precipitation for the month was 2.72 inches, the normal being 3.61 inches. There were 143 hours of bright sunshine as compared to a normal of 137 hours. There were high winds on January 13, the maximum being 40 miles per hour.

Note-The first column in the above summary gives observations made during the month. The second columin gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1945.

## REMARKS

February was a severe winter month. The mean temperature was 22.6 degrees, the normal being 23.7 degrees. This makes the month the coldest February since 1936. The lowest temperature was -8 degrees on the 4 th and the highest, 51 degrees on the 14th. The heating load during the month was 1187 degreedays, the normal being 1165 degree-days. The total heating load from September to the end of February is 5139 degree-days as compared to a normal of 4982 degree-days. The snowfall during the month was 18.30 inches. The normal snowfall for February is 13.99 inches. The total snowfall for the season is now 60.4 inches. The normal snowfall to the end of February is 38.15 inches and the normal snowfall for the year is 47.78 inches.

There were 174 hours of bright sunshine. This is well in excess of the 158 hours which is normal for February. The relative humidity was 63 percent compared to a normal of 66.5 percent.

There were high winds on the 15th and 20th. On the former date $a$ velocity of 48 miles per hour was recorded and on the 20th the maximum was 50 miles per hour.

[^37]
## REMARKS

The weather during March was unusually warm, with much sunshine, very little rainfall and only a trace of snow. The mean temperature for the month was 44.5 degrees which exceeds the all-time record for March set last year by one-tenth of a degree. The normal mean temperature for March is 34.4 degrees. The maximum temperature was 83 degrees on the 29th and the lowest, 8 degrees on the lst. Last year the maximum temperature in March was 85 degrees which also occurred on the 29th, and this is the highest reading ever recorded in March. The college pond was clear of ice on March 20. The heating load during the month was 636 degree-days, while the normal for March is 950 degreedays. The total load for the season to the end of March is 5775 degree-days, the normal for this period being 5932 degree-days.

The total precipitation was 1.60 inches, all of which fell as rain except for a light snow squall on the llth. Normally we get 7.47 inches of snow, with a total precipitation of 3.70 inches. The total snowfall for this winter to the end of March is 60.40 inches, which is the heaviest seasonal fall since the winter of 1925-26 when 61.00 inches was recorded. The normal for the same period is 45.62 inches.

There were 283 hours of sunshine, compared to a normal of 199 hours; and 21 days were classified as clear. The mean relative humidity was 64.2 percent, while the normal for March is also 64.2 percent. High winds were recorded on the 3rd, 9th, 10th and 27th.

Dr. J. K. Shaw makes the following report on the progress of vegetation: "The temperature this month has been slightly higher than it was during the abnormally warm March of 1945. Vegetation has advanced to about the same stage and our comments of a year ago can now be repeated. 'The extremely high temperatures in March have advanced vegetation so that it is about as far along as it was a month later last year. Grass is green and leaves are developing on many shrubs. Forsythia is in full bloom at the last of the month. It is, so far, the earliest spring in many years.' The month closes with cooler weather; if this persists, it could delay bloom of fruit trees until danger of frost injury is decreased. It would require a temperature around 20 degrees or possibly a little lower to cause serious injury to fruit buds at the present stage of development. We can be quite sure that bloom will be earlier than normal and that there will be a decreasing probability of cold injury until late May or even early June. We can hope to escape cold injury this year, but we may as well admit that the fruit crop of 1946 is in great danger.
"Fruit trees came through the winter in good condition. No winter injury has been observed, and most fruit trees are full of flower buds. Few peach fruit buds were killed and the prospect is for a heavy bloom. The fruit crop of this year hangs in the balance. If it escapes cold injury, there will be a big crop. If cold comes, it may be reduced even to destruction."

## REMARKS

The weather during April was dry and slightly cooler than normal. The precipitation during the month was only 2.16 inches, normal for April being 3.35 inches. The snow fall during the month was 1.50 inches, the normal snowfall for April being 2.17 inches.

The mean temperature during April was 45.0 degrees. This is only half a degree higher than the mean during March this year. The normal mean temperature for April is 45.7 degrees. The lowest temperature was 19 degrees on the 1st. The domestic heating load for the month was 602 degree-days compared to a normal of 579 degree-days. The heating load for the season is 6377, the normal to the end of April being 6511 degree-days.

There were 228 hours of bright sunshine which is 8 hours more than normal. Mean relative humidity was 64.6 percent, the normal being 61.6 percent.

Dr. J. K. Shaw makes the following report on the progress of vegetation:
"While March 1946 was very similar to March 1945, the month of April 1946 was distinctly cooler than April 1945. As a result, vegetation advanced very slowly. At the end of the month most apple varieties were in the pink stage of bloom and will be in full bloom with two or three warm days, probably about two weeks ahead of normal instead of three weeks or more as last year. On the morning of April 1 there was considerable cold injury to fruit buds. In our orchards no serious crop damage occurred. In other orchards about the state, there was more injury. Possibly some low lying orchards suffered enough to reduce or ruin the crop, but it seems very unlikely that the crop over the state was much reduced. We have had several narrow escapes since, but we believe that there has been no further damage.
"Practically all fruit trees in our orchards show extremely heavy bloom. Rarely and probably never have we seen our orchards so full of flowers in all our experience of nearly 40 years. The season of 1945 must have been very favorable for fruit bud formation. The crop loss was one reason, but there must have been others.
"While every dey brings us nearer the time when we can feel assured of a good crop, there is still danger of cold injury. A minimum temperature of $27^{\circ}$ or $28^{\circ}$ would cause heavy damage. The next two weeks will be the critical period. While injurious cold may occur after the middle of May, it is not probable."

## REMARKS

May weather was colder and wetter than normal but neither as wet nor as cold as May, 1945.

The mean temperature during the month was 55.8 degrees, the normal being 57.1 degrees. May of last year was 54.1 degrees. The lowest temperature was 30 degrees on the 3rd. The 3rd and 4th are the only days on which the temperature fell below freezing. The highest temperature was 86 degrees on the 25th. The domestic heating load was 298 degree-days, the normal being 267 degree-days. The heating load for the season is now 6675 degree-days, the normal for the year to the end of May being 6778 degree-days.

The total precipitation for the month was 5.41 inches as compared to a normal of 3.60 inches. The rainfall in May, 1945 was 6.45 inches. The precipitation since January lst is now 15.41 inches, while the normal for this period is 17.45 inches. Rain fell on 15 days. Rain fell on 20 days in May, 1945. There were 254 hours of bright sunshine which is two hours higher than normal. Relative humidity was 54.8 percent, the normal being 60.7 percent.

Dr. J. K. Shaw comments as follows on the progress of vegetation: "The early part of May this year was cooler than May, 1945 and the relatively slower development of vegetation of April continued. Full bloom of apples occurred during the first week in May, about two weeks ahead of normal. As in 1945, the blooming period was much longer than usual. At the end of May, development was fully back to normal. All tree fruits produced a remarkably heavy bloom.
"Cold injury during April varied in different orchards from none to severe. There were three mornings in May when the temperature was dangerously low. These were May 3, 4 and 9. On May 3 there was some further injury to apple blossoms. We can, at the end of the month, feel fairly sure that the fruit crop is past danger from cold. Contrary to common belief, peaches are more resistant to spring cold than apples and a good crop is probable; there was little or no killing from mid-winter cold. The apple crop will be much larger than that of 1945 and may be up to normal. The set of fruit of some varieties is rather poor and there may be further loss as the 'June drop' is not yet completed.

Fernand E. Bartlett, Observer

## REMARKS

June weather averaged near normal, the rainy first half of the month being offset by the hot, dry spell the last half of the month.

The mean temperature for the month was 65 degrees, the normal being 65.7 degrees. The maximum temperature was 92 degrees on the 27th, with the daily maximums for the last eight days ranging from 83 to 92 . The minimum temperature was 39 degrees on the 3rd, the normal minimum for June being 40 degrees. The domestic heating load for June was 100 degreedays, the normal for this month being 68 degree-days. The total heating load for the past season is 6775 degree-days as compared to the normal of 6846 degree-days.

The total rainfall for the month was 3.30 inches, while the normal is 3.75 inches. The total precipitation since the first of the year is now 18.71 inches, compared to the normal of 21.20 inches for the some period.

There were 17 clear days this month, whereas during the month of June last year precipitation fell on 17 days. There were 331 hours of bright sunshine compared to a normal of 257 hours. The maximum wind velocity on the llth was 47 miles an hour.

Dr. J. K. Shaw makes the following comment on the progress of vegetation: "The first part of the month of June was characterized by excessive rainfall and much cloudy, humid weather. This, together with the heavy carry-over of scabby leaves, resulted in one of the worst apple scab years for a long time; there will be a lot of scabby McIntosh this fall. The set of apples was fair and a crop nearly or quite up to average is indicated at present. In some orchards on frosty locations the crop of apples will be light or none. The crop will not come up to the promise made by the remarkably heavy bloom. Peaches generally escaped blossom killing and there should be a good crop. Weather for strawberries was favorable, plenty of rain during the growing period and drier weather during harvest. Available supplies are restricted by the reduced area devoted to this crop. The month closes with a hot period with little rainfall. Conditions have favored a good hay crop and harvesting conditions have been good so far."

## REMARKS

The unusual feature of July weather was the heavy rain on the 23 rd . A total of 3.46 inches fell on that day. There was no rain from the 2nd to the 2 lst but a total of 4.49 inches fell in the storm from the 21st to the 23rd. The total rainfall for the month was 5.30 inches, normal for July being 4.10 inches. The total precipitation from January 1 to July 31 was 24.01 inches. The normal precipitation for this period is 25.30 inches. The mean temperature for Juily was 70.2 degrees, normal being 70.8 degrees. Rain fell on only 6 days and there were 319 hours of bright sunshine compared to a normal of 268 hours. Relative humidity was 69.2 percent. There were no high winds during the month.

Dr. J. K. Shaw, research pomologist, makes the following statement: "The dry period which began the latter part of June continued until July 22 when heavy showers relieved the situation. The strawberry crop was far enough along to mature a good crop before conditions became severe, but raspberries suffered severely. Lawns became brown where the soil was not retentive of moisture. The dry weather must have delayed the growth of apples and possibly other tree fruits but they will resume growth with a more abundant water supply. The bad scab situation caused by so much moist, rainy weather in the spring continues, and susceptible varieties will show the effects even with a continued vigorous spray program. Other diseases and insects of tree fruits have not yet caused unusual damage.
'"The peach crop will be good except in orchards in frost pockets. The apple crop is spotty, spring frosts having reduced or destroyed the crop in some orchards while others will produce a nearly normal crop. It is reported that the crop in Massachusetts will be about three times that of the very short crop of 1945 but still considerably below normal.
"Cultivated blueberries suffered from spring frosts and the dry weather, during which the berries did not grow well, and when the showers came there was much cracking in varieties susceptible to such injury. The crop will be below normal."

## REMARKS

August weather was colder than usual, with the total precipitation for the month only .08 inch less than normal.

The mean temperature was 66.1 degrees, while the normal for August is 68.6 degrees. This is the coldest August since 1934 when the mean temperature was 65.0 degrees. The record at this station for August is 62.4 degrees in 1903. The maximum temperature for the month was 89 degrees on the 9th, while the lowest was 45 degrees on the 31st.

The total precipitation was 4.00 inches compared to the normal for August of 4.08 inches. Rain fell on 15 days. There were 239 hours of sunshine, while the normal for August is 237 hours. There were no high winds during the month.

Dr. J. K. Shaw, research pomologist, gives the following report: "Rainfall continued to be ample during August and the effects of the dry period of June and July have disappeared. Vegetation has progressed normaliy. Temperatures seem rather low for August but no frosts have been reported. The apple crop will be larger than seemed possible at the time of the spring frosts though some low-lying orchards have a small crop or no crop at all. Scab on susceptible varieties will be severe. Conditions have not been favorable for good color development but abundant sunshine and cool nights may still favor color in later varieties. The peach crop is up to or above average."

The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1945.

## REMARKS

September weather was warmer than usual, with a little more sunshine, humidity and rainfall than normal.

The mean temperature for the month was 63.9 degrees compared to the normal for September of 61.7 degrees. The highest temperature was 86 degrees on the 19th and 20th. The lowest was 37 degrees on the 14th and consequently no frosts occurred in September this year. Also no frosts were recorded in September last year. The normal date for first frost at this station is September 21.

The domestic heating load for the month was 90 degree-days compared to the normal for September of 149 degree-days.

The total rainfall for the month was 4.88 inches, while the normal is 4.24 inches. Most of the precipitation fell in three storms: 1.21 inches on the 8th and 9th, 1.40 inches on the 24th, and 1.85 inches on the 30th. There were 242 hours of bright sunshine while the normal is 201 hours. The mean relative humidity was 78.4 percent, the normal for September being 73.6 percent.

Dr. J. K. Shaw, research pomologist, reports as follows:
"There is nothing extraordinary to report about the weather and crops in September. Progress was normal. A good peach crop was harvested from our orchards and others in good locations. Our apple crop is poor in the orchards on lower elevations but good in the better located orchards. McIntosh suffered from the early freezes and probably cool weather following bloom interfered with the set of fruit, but not as much as it did in 1945. The unseasonably warm weather in March, followed by cold which killed many fruit buds, threatened ruin but still most orchards came through with fair to good crops. Injury was severe to total in orchards in frosty locations."

## PEMARKS

The weather during October was warm and dry, and had very little wind. The mean temperature was 54.7 degrees compared to a normal of 50.5 degrees. During the first half of the month the temperature was near normal but was well above normal in the second half. While the mean temperature was considerably above normal, this record was exceeded in 1900, 1913, 1920 and 1938. In 1920 the mean temperature for October was 56.4 degrees. The highest temperature in October this year was 84 degrees on the 6 th and 7th. The lowest temperature was 28 degrees on the 22nd. This was the first frost of the season, although there was light frost earlier in nearby locations. At the end of the month there has not bean a killing frost. The normal date for the first frost is September 21.

The domestic heating lood for the month was 326 degree-days. The total heating load for September and October is 416 degreedays while the normal for this period is 605 degree-days.

The totol precipitation for the month was 1.51 inches, which is 1.78 inches less than the normal for October.

The total wind movement was only 2914 miles for the month, while the normal is 4074 miles. Only twice since 1889 has there been less wind in October.

Dr. J. K. Shaw, research pomologist, gives the following final report on the crop season of 1916: "The crop season of 1946 may be said to end with October. In many ways it was remarkably like that of 1945. The vieather was unseasonably warm in late winter and early spring, then cooler with killing temperatures followed by seasoncible femperatures for the rest of the summer. Rainfall was low in March and early April both years and again in June and July, followed by more adequate cimounts ending with dry Catobers. For three successive years the fruit crop has been injured more or less severely by spring killing of fruit buds. The writer remembers oniy one spring in the previous 38 years when severe killing occurred in Massachusetts. Three frosty years in succession sets a record that will not be equaled for a long time. If we get frost damage in 1947 it will be most remarkable.
"Apple scab caused much domage to scob susceptible varieties in both years becaure of wet weather in May and June. The carryover of the disease on fallen lecives is heavy. Unless we have a dry May and June in 1947, a most thorough and skillful control program will be necessary to control the disease."

## REMARKS

The weather during November was warm and dry. The mean temperature for the month was 43.2 degrees while the normal mean temperature for November is 38.9 degrees. This high mean temperature for November has been exceeded only three times since 1889, in 1927, 1931 and 1935. The highest temperature was 68 degrees on the 4th and the lowest 19 degrees on the 19th. The first frost of the season was on the 13th. The domestic heating load was 654 degree-days compared to a normal of 784 degree-days. The total heating load to the end of November is 1070 degree-days while the normal for that period is 1389 degreedays.

The total precipitation during the month was .70 inches. Only once has there been less precipitation in November since 1889. This was in 1917 when the total precipitation for November was .63 inches. The normal for November is 3.41 inches. No snow fell during the month whereas the normal snowfall for November is 2.34 inches. The normal date for the first snow is November 6.

There were 126 hours of bright sunshine, the normal being 121 hours.

## REMARKS

The weather during January was much warmer than normal with very little snow. The mean temperature was 27.7 degrees, which is 3.5 degrees higher than the normal for January. This was the warmest January since 1937 which had a mean temperature of 31.7 degrees. Last year the mean temperature for January was 23.2 degrees. Thus far, this has been the warmest winter since 1931-1932. The highest temperature this January was 55 degrees on the 31st while the lowest was -1 degree on the 10 th and this is the lowest reading so far this winter.

The domestic heating load for January was 1157 degree-days as compared to the normal of 1265 degree-days. The total heating load from September 1 to January 31 is now 3315 degree-days as compared to the normal of 3817 degree-days for this same period.

The snowfall for January was 3.0 inches while the normal for January is 13.32 inches. The total snowfall for this winter has now reached 13.5 inches. The normal for this same period is 24.16 inches. The total precipitation for January was 3.37 inches which is slightly under the normal of 3.61 inches. There were 112 hours of bright sunshine as compared to a normal of 137 hours. High winds occurred on the 21st when a maximum of 32 miles per hour was reached.

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on olservations made from 1889 to 1938, except that humidity recorls are hased on ohservations made from 1929 to 1938. The third column gives extremes observed from 1889 th 19th.

## REMARKS

The weather for February was near normal. The mean temperature for the month was 24.0 degrees as compared to the normal of 23.7 degrees. The highest temperature during the month was 50 degrees on the 4 th and the lowest, 4 degrees on the 9th and 20th. The lowest temperature for the winter still stands at -1 degree on Jaunary 10. The domestic heating load for the month was 1148 degree-days, while the normal for February is 1185 degree-days. The total heating load for the period September 1 to February 28 inclusive is now 4463 degree-days compared to the normal of 4982 degree-days for this period.

A total of 18 inches of snow was recorded during the month, with 16.5 inches of this amount falling in two storms. The total snowfall for this winter season is now 31.50 inches, while the normal for the period is 38.15 inches.

There were only six days of precipitation during the month. The total hours of sunshine was 144, while the normal is 158 hours. The total wind movement for the month was higher than normal.

## REMARKS

The weather during March was a little colder than normal with mean temperature of $34^{\circ}$ compared to the normal mean of $34.4^{\circ}$. Last year we had the warmest March on record with mean temperature of $44.5^{\circ}$.

The mean temperature for the winter season now stands at $31.8^{\circ}$ compared to the normal for the same period of $29.7^{\circ}$. Highest temperature of $55^{\circ}$ this month occurred on the 24th; the normal high is $63.8^{\circ}$. The lowest temperature of $11^{\circ}$ came on the lst; the normal low is $6.1^{\circ}$. Record high was $85^{\circ}$ on the 29th in 1945 and the record low is $-7.5^{\circ}$ as of March 24, 1906.

Degree-days for March were 962 against a normal of 950 . The heating period, September 1 to March 31, is 5425 degree-days which is somewhat below the normal of 5932 degree-days.

There was less snow than usual when only 3 inches fell. The normal is 7.47 inches. Total snow of 34.5 inches this winter is considerably below normal of 45.62 inches. The normal for the entire snow season is 47.79 inches.

Precipitation is less than normal for March when 3.29 inches fell. The March normal is 3.70 inches.

There were 199 hours of bright sunshine which was the same as the normal.

Humidity was 62.9 percent; normal is 64.2 percent.
Two very low barometric readings developed in March when 28.63 inches occurred at 6 A.M. on the 3rd and 28.88 inches at l P.M. on the 25th. The hurricane of 1938 had a low barometer recording of 28.41 inches. Both lows this month were accompanied by high winds. Maximum velocity of 45 miles per hour was recorded on the 3rd.

## REMARKS

The weather during April had about an inch more precipitation and a slightly lower mean temperature than normal. Precipitation totalled 4.59 inches which was fairly well distributed over 10 days. The normal precipitation is 3.35 inches. Mean temperature was 44.7 degrees while the normal mean temperature is 45.7 degrees. The highest temperature of 74 degrees occurred on the 6 th and 30th; the normal is 79.4 degrees. The lowest temperature of 23 degrees was recorded on the 4th; the normal low is 22.0 degrees.

The snowfall totalled 2.25 inches compared to a normal of 2.17 inches. The total for the season is now 36.75 inches which is below the normal of 47.79 inches. The total hours of sunshine is 183 and this is somewhat below the normal of 220 hours for April.

The domestic heating load for the month was 608 degree-days which is above the normal of 579 degree-days. The season's total from September 1 to the end of April is now 6033 degree-days which is considerably less than the normal of 6511 degree-days.

Dr. J. K. Shaw, research pomologist, gives the following report: "The past winter was mild with only one sub-zero temperature recorded. Peach fruit buds came through with little killing and a full bloom is in prospect. There should be little or no winter injury to fruit plants. The progress of vegetation to May lst is about normal and from two to four weeks later than it was in the last two years. Fruit buds are swelling and a few days of warm weather will bring them into bloom. There will be ample bloom on tree fruits but probably not equal to the heavy bloom of last year. Some leaf area of apple trees is exposed and the wet period at the beginning of May is favorable for infection from the heavy carryover of apple scab from last season. Thus the stage is set for another season of severe injury unless adequate preventive measures are taken."

## REMARKS

The weather for May was slightly colder than normal, with a little more precipitation than usual.

The mean temperature for the month was 56.1 degrees, while the normal for Mlay is 57.1 degrees. The highest temperature during the month was 87 degrees on the 13 th and 24 th; the lowest, 28 degrees on the 10th. The domestic heating load for the month was 277 degree-days, compared to the normal of 267 degree-days for Nay. The heating load for the season to the end of May is now 6310 degree-days, while the normal for this period is 6778 degreedays.

The total precipitation for the month was 4.63 inehes, most of which fell in two storms: 1.00 inch on the 3rd and 2.10 inches on the 25 th. The normal precipitation for May is 3.60 inches. Thunder and lightning oceurred on the 25th and 29 ti. Rain fell on 14 days. In May, 1945 rain foll on 20 days. There were 225 hours of bright sunshine. The normal for May is 252 hours.

Dr. J. K. Shaw of the Pomology Department makes the following comments: "For the fourth successive year the Massachusetts apple crop has been injured by spring frosts. There is no record of such a condition as far back as records go. Unlike the previous two years, the program of vegetation was retarded: fruit bloom was a week or ten days later than normal instead of three or four weeks early. Several cold mornings in late April and in May killed many apple blossoms, some in the early eluster bud stage and some later. Bloom was less than the heavy bloom of last year. The apple crop in low lying orchards will be much redueed but we may hope that the total crop will be considerably more than last year. Wuch wet weather favored scab development and only thoroughly sprayed orchards of susceptible varicties can escape severe scab injury. Severe frost damage is reported from more southern areas and it looks as though the 1947 eastern apple erop will be below normal.
"There was little or no injury to peaches and pears, and full crops are in prospect. Early strawberry bloom was killed, thus retarding the crop, but present indications are for a good crop."

The third column gives extremes observed from $188^{9} 9$ to $1^{19} 46$.

## REMARKS

June weather was colder than normal, with slightly less rain than usual.

The mean temperature for the month was 64.6 degrees, while the nomal for Junt is 65.7 degrees. The maximmom temperature was 91 on the 28 th and the minimum, fon the th. The demestic hrating load for 3 une was 88 depree-days compared with the normal for June of es degres-mas: The lotal had for the herding season for the period september 1 to June 30 is sine biass degree-days. The nommat for the prriod is 6846 degreedays.

The total precipitation for the month was 3.22 inches, while lhe nomal for bum is 3.5 inches. There were 15 clear diass 10 partly donds, and a choude
 on the progress of vegetation:
"The wather during dane continad to be aod and wet, ret tarding the progress of vegetation. Theor conditions favered seab development and only orchards intensively sprayed est aped serieus infertion. Scab spores matured aaty bot infertion in our own orchards was murh lose than lasi year, probably because of a boter spaay pregath. Wohotosh set poerly and the crop in our orchards will be the whallest in mens years. Comditions for pellinadion secmed to be faidy gered and it is difficult to tind reasens for the poore set. Frost was domblese a factor and the exerssive leat scab of last your may have weahemed the treen. Howt wher varidtion hatese at bati fairly woll though the caty boming (iravenstain hakl man! borams killad.

Pearhes and pears promis fall (rops that the bueberry crop will be below normal. Strawheries an yedding woll."

## により【にば

Jaly was both hotter and drier than normal．The mean of 73.2 degrees equals 1935 and has been exceeded only by 1921 and 1911．The mormal maximum temperature，however，was not reathed with 91 degrees on the 30 th．Precipitation was reeoreded on 14 dass but mose of it fell in two storms on the lath and the 22d，feaving the month 1.37 inches short and the lear 1.51 inches below normal at the monthes end There was mere wind mosement than mormal and more than in ans pear simee 1932 ．I lonrs of bright sumshine wre more than itormal．These things all eombined to the benefit of the tobaeco hamest but lawns，gradens and field erops dependent on duty moisture showed the efleets of greater than normal temperatures and the deledenes in mormal precipitation．
（）r．J．K．Shaw，researeh pomelogist，mahes the following statement：＂The progress of tegetation during July was generatly normal．Sll fruit erops progressed as usual and ronsequently there is nothing speetal to be put on reeord．Our own apple crop， esperially Melatosh，will be shert white that of the state is re－ perted to be abose that of last sear．It will be spotls，some orehards vedding bers well and others poorls．The apple crop in the Sppatarhian region was badts injured bs spring frosts，while there was litale injury further north．In general the fruit（rop）of the comotry seems to be at least mp to momal and we mat expeet a good suppl！in 19t7．＂

Note-The first column in the above summary gives observations made during the month. The second column gives the aterages based on observations made from 1889 to 1938 , except that humidey records are based on observations made from 1929 to 1938 . The third column gives extremes observed from $1 \mathrm{seg}^{9}$ to 19 ft .

## REMARKS

The weather for the month of August provided a most uncomfortable combination of heat and humidity with few breaks, and recorded below nomal precipitation. It was the warmest August since 1939 and reereded! the highest mean relative humidity in the past 18 years. Whate the high of 95 degrees was recorded on but 3 days, a tempratare of 90 degrees or more was recorded on 8 days of the month. The highest maximmm, 100 degrees on Augist 7,1918 , was mever reached but only 1937 and 1939 have recorded warmer dugusts since 1837, the begimning of weather records at 1 mbierst. Of the 1.69 inches of precipitation for the month, 1.45 inches was reorded in 2 storms on the 16 th and 26 th, and measurable precipitation occured on 6 days. The cumblative deficiency in precipitation is shown by the 7.64 inches recorded for June, July, and Sugust against a nomal of 11.93 inches for this period. There were bo high winds during the month.

Dr. J. K. Shaw, research pomologist, makes the following statement: "The weather during Xugust has been characterized bs a lach of ramfall. While the drought this late in the seasom has not been severe enough th seriously injure the fruit erop, it mas hatw slowed the rate of grenth al the fanit. Probably the apple harvest will be a lifle later than a crage due mestly to late bleom. The apple crop in the 1 niversity orchards will be below average due principally Io a short Vehotesh crop. Roports indicate that the erop over the state will be larger than the small erop of 1946. Peaches are gedding well and other tree fruits are good. The blue-

Note-The first column in the above summary gives observations made during the month. The second column gives the arerages based on observations made from 1889 to 1938 , except that humidity records are based on observations made from 1929 to 1938 . The third column gives extremes observed from 1889 to 1946 .

## REMARKS

September weather was not violently extreme but it avoided the normal in almost every eategory. While the mean temperature for the month hedd 1.2 degrees abose normal, 184 degree-days of heating load were accumblated asainst a normal of 149 for the largest September heating load since 1938. Recording a maximum temperature of 89 degrees on the 12 h and 13 th at 1.3 degrees above nommal, the 29-degree minimum on the 27 th and 28th gave the month's $x$ reatest range and lowest minimum since 1942. With the mean date of list frest September 21 . September 27 recorded the first frost of this seasen for the carliest denter since 1940 .

Preapitation contimed the trond of ther past three months with a below nomm 2. St inches for the month and : below normal $28.2 \underline{2}$ inches accumbladed for the $r$ mar. Normad for the month shows a delicieney of 1.40 inches, a a d the year short of normal by 5. 30 inches. The storm of the 2 d yedded 1.21 inehes and there we measurable meripitation on six wher days of the month. High winds aceured on the 2eth with the maximmm vedocity recorded at 40 miles per hour.
W. 11. Thies. Extonsion Professor of Ilorticulture, contributes the following report: "The Vhelntesh apple harvest which nor mally bereins around september 1.5 is delayed this year for at least two rectome. In the firet plare. hom was about 10 days late last sprine, and simer appoximately the same number of days dapses fotween bloom and maturity, later maturity might be expected this year. Then, foo, weather condititns in eady seftember were unfavorable for the coloming of apples. In fact, lese celor was apparent on Geptember 2.) than warmonty find on Soptomber 15. Not matil the list werk in September, when dear days pollowed cold
 this drayed coloring, apples bave hung on the tree mansatly wedl this fall. As a result, more Volntosh will be harvested during the first wrek in Octuber than in the last twenty-five years."

Note- The first column in the above summary gives obscrvations made during the month. 'The second column gives the averages based on observations made from 1889 to 1938 , except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from lise to loto.

## REMARKS

The weather during October was bright, warm and dry, with 18 clear and 6 fair days, and all but the last 3 days of the month recording some amount of bright sunshine. Until the storm beginning the $29 t h$, the month had recorded .08 inches of rainfatl and the 4 previous months had recorded 10.48, bidding for a record drouth in the 5 -month peried and developing the woodland into a fire hazard of major proportions. The month finally recorded a deficiency of 1.25 inches below normal and the 5 months period a cumulative 12.52 inches against a nommal of 19.46 inches of rainfall.

Examination of the records maintained since 1836 discloses that this month established a record mean daily temperature with 57.4 degrees. October 1920 with 56.4 degrees is nearest this record and 1879 with 56.0 is next. On only 2 days were minimum temperatures of less than 32 degrees recorded. The 23 -flegree minimum on the 25th and the high of 86 on the 16th gave both the highest maximum and the greatest range for the month since 1941. Seven days of the month recorded mean temperatures in excess of 6.5 degrees. The heating load for the menth is 249 degree-days and cumulative for the season 433 , slightly higher than last year's cumulative, 416 , but still only $72 \%$ of normal heating requirement to Octuber 31.

There were no high winds during the month although the fresh to streng winds which occurred between the 19th and the 24 th gave trouble in nearby localities affected by forest fires.
W. H. Thies, Extension Professor of Horticulture, contributes the following report: "The month of October has been very favorable for fruit trees in some cases, and less so in others. On fertile, retentive soils, leaves have functioned later than usual thus encouraging the development of fruit buds and the storage of carbohydrates. This will tend to promote tree vigor and productiveness in 1948. There is little evidence, in preperly managed orchards, of a lack of matarity in the trees, a condition which commonly precedes one type of winter injury. On peorer soils, trees have probably suffered from a fluctuating water supply and from certain mineral deficiencies which accompany a water shertage. Such trees lost their leaves even before severe frosts had oferurred. Octeber weather has been favorable for the continued development of strawberry "runners." In fact, some matter row plantings undoubtedly have more plants than are needeed for a full crop.'

Correction: An error in barometric rearlings on page 3 in the June 1947 bulletin gives 30.70 as the maximum on the 1 st, 29.49 as the minimum on the 16 th and 1.21 as the range. The correct rearlings are as follows: The maximum was 30.34 on the 21 st ; the minimum, 29.65 on the 15 th; and the range, 69 .

## REMARKS

The weather for the month was both colder and wetter than normal. The 5.63 inches of precipitation recorded the most rainfall for the month since 1942 and brought the year's cumulative to 35.99 inches which is still 4.33 inehes under the normal. The mean temperature for the month was registered at an even 38 degrees, 0.9 degrees below normal for the coldest November since 1939.

No scrious storms occurred during the month although 2.46 inches of rain fell on the 12th.

The heating load for the month was 826 degree-days, the greatest for the month since 1939. Cumulative heating load for the season now stands at 1259, which is 130 degree-days below the season normal and indicates only 18.4 instead of the normal $20.3 \%$ of mean heating load to have been accumulated at the end of the month.
W. H. Thies, Extension Professor of Horticulture, contributes the following report: "From the standpoint of fruit crops, the weather during November has been quite favorable. Temperatures have been low enough to cheek tree growth and to encourage hardening of tissues. Only onee has the temperature dropped as low as $15^{\circ}$ in contrast to near zero weather in late November in years past. Conditions are now ideal for mulehing the strawberry planting to provide protection against deeper freezing and consequent heaving of the soil.

Rainfall amounting to 5.63 inches has helped to replenish soil moisture although we are about 5 inches short of normal for the year. In this connection, it should be pointed out that total rainfall is of less significance than the amount which actually penetrates the soil where it falls. An apple tree on a sloping area, for example, may be greatly benefited by contouring or by a heary mulch which encourages penetration of water otherwise lost in flowering to a lower level. Good management of a fruit planting tends to conserve both moisture and fertility."

## REMARhs

The weather for the month of January was consistently cold and was accompanied by a considerable fall of light density snow. The snow fall of 20.5 inches was considerably over the normal 13.32 inches, but the water yidld was only 2.63 inches ageinst a normal of 3.61 inches of water. Of the 38.0 inches of sn wfall cumblative for the season, 17 inches remained on the ground on the 31st.

The lowest minimum temperature of the month, - 16, securred on the 24 th. This was 10 degrees short of the record - 26 of Janbary 1904 and was 5 degrees warmer than the 21 recorded in January 1935. The maximm of 39 degrees reconded on the 9th is the lowest maximmom temperature recorded in the month since the beginning of our records. The normal mean maximm for January is 51.1 degrees while the mean maximm recorded for the current month was 27.1 degrees.

The mean temperature for the month at is.0 degrees was 0.2 degree above Jamary of 1945 hat was eonsiderably below the normal mean of 24.2 degrees. Prier to 194. the mest recent severe Jamary was recorded in 1900. The degeredase of heating load resulting from this wery low mean built to 14.9 for the month and 3932 cumblate for the season, against a normal of 1263 degreedays for the month and a emmative of $381 \%$. On January 22, the midpoint of the mormal heating load, the cummative deqree-days reathed 3431 against a normal of 3425.
II. II. Thies. Extension Profeseor of Horticultare, contributes the following report: "An umsually hears hanket of soow during January has offered good protection to plant rowts and has bern highly law orable fore fall serdings. Some smotheringe of new eredinges may oceur. howeser if a layer of ice forms on top of the show as a result of freceing theperatires during subsequent rains. The heavy sow cover will have another faverable effect in that a mojor pertion of the winter pre ipitation will be able to penetrate the
 the will. This assmes or comere a moderate rate of meting of the show.

The tenemathere in rarious parts of the State hav diopped betow the reitioal print fo peach bods (about 15 ). Thi will undoubtedl mean seme reduction in the 1948 peach crop. Lithe "if ne damage to apple bads is apparent thas far. Fruit growers mas. apect considrable mouse damage in orchards with heary wain condr, where control measures were not carried out last fall."

## REMARKS

Ther wather for the month was near normal in most respects. A behow mermal minimm baremeter on the $1+$ th occured on the same date as the near record te-mph maximm wind velocity, and the maximm barometer reading for the month is topped only by the reend of 1920 . The 1 rinch suowfall is ony slightly above the normal. 13.99, but the precipitation in water is still below nemal at 2.45 inclres for the menth. The 23 storms of the current seasen have reorded a total of $\overline{3} 3.0$ inches of som to the menthes cod considerably abow the nomad 38.15 ine hes but not crowding the 71.5 ine hes of the $1892-1893$ reromed.

The mean minimm at 10.6 denrees is 3.2 degrees betew the normal. and the mean temperature for the menth widted at 2.3 degrees belen momal. This is reflected in the degree days of heating had of 1264 for the menth and 5196 for the season against the nermats of 116.5 and 4982 degree days. Thens the momal hrating load would be te. fe? completed at the monthes end, and if the current season is to follow the same trend, the seasom's tetal load extimates at $\mathbf{7 1 . 0 0}$ degree days against the nermal total of (i8.50, omly $4.4^{\prime}$, above nemmal, but $11.7 \%$ abere last seacen.

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938 , except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1947.

## REMARKS

The month of Warch brought wetcome retief frem a winter which had provided both protenged cold and snow cover of above normal. Early in the month howerer the reeord Nareh minimum of - 1t was established on the bith, seren degrees eolder than the previous reford of -7 wathed in 194:3 and 1906. This compled with a 69 maximum on the 31 st established a recend range of temperature of 83 degrees for the nomat range is but 57.6 degrees. The tag end of winter atso brought 15 inches of snow fall for the month against a normal of 7.47 giving a total for the season to the month's and of 68.0 inches.

The mean temperature for the month of 34.9 degrees was an even one-half degree above the nermal. While comfortable daytime temperatures were reached on most days after the 5th. the meming of the lath recorded the first oremight period of the season without freering temperatures and the third night with abowe-freezing temperatures since last \onember 12. The degresdays of heating load for the menth were ! 932 against a nermal of 950 and the season's total of 6128 aquans a normal of 5932 deqreedays. With the nermal heating load $86.5 \%$ completed the the end of the menth, the heating load fer this seasen can be estimated at wes little orer the nomal of (isan) degree days.
II. II. Thies, Extension Professor of Horticulture, contributes the following report: "One of the most surprising features of the weather during lareh was the sery rapid disappearance of a hears accumulation of show. And, contrary to fears of mans people, this was afeomplished without serious flood conditions. Two or three wam dass compled with the absenee of frest in the seil madre it pessible for the earth to abserb the melting snow "like a sponge". Sery littersil eresion has oceurred and wells have been replenished.

From an agricultural standpoint, the hears blanket of snow has, in general, been beneficial. The winter precipitation has been permitted to penetrate the earth where it fell instead of flewing into the low lands as eremes when the soil is deeply frozen. Fatl seedings hate eome through the winter in realtiach grool eondition. Fruit buds, with the exerption of peacher which sulfered frem low tomperatures, look promising. Strawberries look mosmally groed, having bern subjerted to little or no injury during the winter. shome injury to conifers exposed to dreing winds has, hewever, been noted and there has been some breakage of soung fruit trees due to the beats snow. It is gratifying to see how generally farmers are grewing winter re on areas subject to both wind and water wresion. This is a mone in the diredion of sembenservatom.'

## REMARKS

While the month of April provided considerable clondy weather and only $1: 9$ hours of bright sunshine against a normal of 220 . precipitation continued to remain below normal with only e.si inches recorded against a normal of 3.3. inches. In spite of the heavy snow cover from which little was lost to flooded streams, moderately dronthy conditions are noticeable. The precipitation for 1948 so far totals 10.8 : inches against a normal of 13.85 inches and the total receired since last Jume 1 is but 32.10 inches. This 11 -months' total is compared to our calendar year average of $43 . \%$ inches for emphasis. April has next to lowest monthly average precipitation in our records, and it normally should not have been expected to relieve the deficit in rainfall, but a greater burden of providing moisture for growing crops is now placed upon the precipitation which falls during the growing season.

The clondiness may have contribnted to less extremes in temperatures during the month as a range of 50.0 degrees against an average range of $3 i . t$ degrees was recorded. The normal high for the month is $69 . \pm$ while in this month i3 degrees was attained on the ith. The normal mininnm is ?? while 23 degress was recorded the morning of the 11th. The mean daily temperature for the month was 4.2 degrees, 1.5 degrees above the average. This higher mean daily temperature provided a heating load of 336 degree-days for the month against an arerage of 539 . to bring the season's total to $666 \pm$ against a normal of 6.511 degree-dars. With the normal heating season $9.5 \%$ completed by April 30. Warn weather through May and early Tune could make the total for the current season fall very little orer arerage in heating load.

The wind relocity of to mph attained on the 9 th ties the record for the month attained in 1938 and equalled in 1940 and 1945 . There was more wind morement than normal and on 11 days relocities of 20 mph or above were recorded with $\&$ days recording maximum velocities above 3 mph .
IV. H. Thies. Extension Professor of Ilorticulture, contributes the following report: "Weather conditions during April have been favorable to apple growers in at least two ways. (1) Relatively cool weather has retarded irnit bud derelopment enongh to minimize the danger of frost injury during the blossoming season. (碚) Continned dry weather has greatly decreased the danger of pre-blossom infections of apple scab. With McIntosh buds now in the pink stage. we have had only one raing period of sufficient duration to result in scal infection. Tremendous numbers of scab spores are mature, however, and will be released during the next rain.

Present prospects indicate a heavy apple bloom and, in orchards of good location, a moderate peach bloom. No frost injury to fruit buds has apparently occurred during the past montl. With favorable conditions for bee activity during bloom and an absence of damaging frosts during the next three weeks, a larger than normal apple crop may be expected. On lighter soils. newly set fruit trees have required liberal watering."

## REMARKS

The weather for May deviated very little from normal except in cloudiness and rainfall. The precipitation for the month at 5.82 inches exceeded the monthly mean by 2.23 inches bringing the total precipitation for the calendar year to 16.80 inches, 1.0.j inches below normal. Even with the 12 months' precipitation since last June 1 at only 34.23 inches, and this season's total below normal, there are now no indications that water is in inadequate supply. With some amount of precipitation on 18 days of the month the extreme cloudiness held the total hours of sunshine to only a little above half the normal for the month.

Degree-days of heating load for the month totaled 256 bringing the season's cumulative to 6920 degree-days.
W. H. Thies, Extension Professor of Horticulture, contributes the following report: "Weather conditions during May have exerted a direct influence on fruit crops in several ways: (1) With some rain on 18 of the 31 days and with long periods of wet foliage, at least five apple scab infections have occurred where trees were unprotected. McIntosh growers have found it necessary to apply frequent fungidical sprays or dusts to provide protection against these primary infections. (2) Fruit bloom was delayed somewhat by cold weather and during much of the blooming period bees were relatively inactive. In spite of this interference with bee activity, there appears to be a reasonably good set of fruit in many orchards. The effect of nearby pollenizing varieties on the set of McIntosh is especially noticeable. Trees adjacent to a good pollenizer have, in general, prospects for a good crop.
"(3) Newly planted trees and small fruit plantings are off to a good start since the roots have become well established before hot, dry weather has occurred. This has been a distinct advantage on lighter soils. (4) The cover crop in orchards has benefited in the same way as pastures and hay fields. Where the soil was well fertilized and adequately limed, more mulch material has grown during the month of May than would have been the case with less rainfall. On heavy and poorly drained soils, however, growers have been at a disadvantage from the standpoint of getting mired with the spraying equipment."

## REMARKS

It not only seemed to rain more than normal in the month of June, it provided the heaviest precipitation for the month since 1941. In 9 other years since the beginning of our records however the $5.6 \%$ inches received this month has been exceeded, and it was considerably below the record 9.68 inches of June, 1922.

Accompanying this greater than normal rainfall were the expected less than normal sunshine, more than normal cloudiness, and less than normal mean temperature. While none of these were of a magnitude to approach a record value, the condition is worthy of note for its effect on farming operations. The harvesting and curing of forage crops was very difficult due to precipitation, low temperature, high humidity and soft ground conditions. Planting of some crops was delayed greatly due to soft fields and the "continuous" rain.

Degree-days of heat load for the month were 79 against a normal of 68 and the season's cumulative load was 6999 against a normal of 6848 degree-days.
W. H. Thies, Extension Professor of Horticulture, contributes the following: "With rainfall amounting to $5.6 \%$ inches during June, distributed over 19 days, conditions have been very favorable for the continued spread of apple scab and other fruit diseases. Wherever trees are in good vigor, fruits of various kinds have sized rapidly although some yellowing of foliage in areas of relatively high water table has appeared. In strawberry plantings the yield has been somewhat reduced through smaller sized berries where plants were handicapped by root rot, leaf spot, or other unfavorable conditions.

Much of the soluble plant food has been leached from the soils in the Connecticut Valley as a result of continuous rains during the past two months, according to W. G. Colby of the Agronomy Department. Magnesium deficiencies have appeared on fields of potatoes, and nitrogen deficiencies have been evident on both potatoes and onions. Magnesium deficiency symptoms have been aggravated, not only because of the leaching action of heavy rains, but also because of shalllow root penetration which is characteristic of a wet growing season."

## DAILY RECORDS

* Based on least time required to blow one mile.

Lewis F. Wells, Observer

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938 , except that humidity recolds are based on observations made from 1929 to 1938 . The thild column gives extremes observed from 1889 to 1947.

## REMARKS

The weather for Inly was a little warmer than normal. The high of ! It degree- recorded on the $1 ? t$ th is but 0.1 degree above the normal maximum. the lowest temperature recorded for the month was $i$ ? degrees the morning of the 3 th. while the mean temperature for the month became $: 2.3$ against a normal of $\mathbf{0} 0.0$ degrees It will be noted that this increase in mean temperature was accompanied by an above-norma! hours of sunshine and a below-normal mean relative humidit. The result was pleasant weather most of the days of the month.

Rainfall of $\because .!$ incher compares favorably with $\because$. in for July of last year but is 1.1. inche below normal for the month. Total precipitation for the calendar year now stands at e.s.3: against a normal of es.30. with a drouth condition ready to assert itself on most of the lighter soils.
IV. H. Thies. Extension Professor of Horticulture. contributes the following: "With less than three inches of rainfall and relatively hot weather in Amherst during July. conditions have been favorable for a build-up of certain orchard pests, including European red mite. Bronzing of foliage is becoming more apparent here and there and 50 or more mites per leaf have been connted. There has been little if ans spreas of apple scab on the friut. howfiver. since we have had no length rains period during the month.
"The hay harvest in \assachusetts got off to an early start and has apparently been completed somewhat earlier than usual. Hay was. in general. heary and of good quality. Corn and potatoes have made excellent growth during the month although some fields show the effects of earlier leaching of essential elements from the soil. Lawns are in fairly good condition. except on lighter soils where drought symptoms are showing. And, as is usual at this season. some gardeners are worried about the rapid growth of weeds forgetting, perhaps, that garden crops and weeds are subject to exactly the same soil and weather conditions."

The third colmm gives extremes observed from 1889 to 1947.

## REMARKS

The weather for the month of August ranged from warm to bot, with a heat wave the last ten days of the month. From the 21 st to the 30 th the daily maximums were all 85 degrees or higher: from the ?5th to the 28th they were in excess of 9.5. and the 100degree temperature recorded on the 26 th equals the previous August record on August i, 1918. There were 25 clear and fair days coupled with average relative humidity. The six clondy day: were the same six which gave some recorded rainfall. Precipitation was 0.68 inch belon the monthly mean of 4.24 inches. with more than half of the rainfall in the $1.8+$-inch storm on the $1 \%$ th. The moisture condition was slightly more favorable than in 191: as this one storm recorded more precipitation than the entire month a year ago.

The extremely high temperatures late in the montli cansed severe losses in poultry flocks not protected with fan rentilation. Birds on range vacated black-roofed shelters, preferring the heat of direct sunshine to suffocation in the shade, Scald developed in some cranbery loge which appeared to affect the uprights as well as the fruit.
W. 1H. Thies, Extension Irofessor of Horticulture, contribute: the following: "Weather conditions during August have affected the apple crop in several ways. Extremely high temperatures in late August have probabls influenced the amount of sun scald on the fruit ranging $u p$, to 20 percent or more in some orchards. ( 1 similar condition has aloo been noted on tomatoes.) Relatively warm nights have not favored color development. An absence of prolonged wet periods has meant freedom from late season scab infections: in spite of irequent heary infections in early summer. but considerable russeting of the frint is in evidence. This is of common occurrence where the relative humidity is high in contrast to an arid climate. In reality, the heary russeting of some varieties, including Baldwin, may be cue to a combination of spras materials and himmid weather, particularly in early summer. The average size of apples is quite satisfactory except on drier soils or where the foliage has suffered severe injury from insect. or diseases."

The second column gives the averages based on observations made from 1889 to 1938 , except that humidity records are based on observations made from 1929 to 1938 . The third colmm gives extremes observed from 1889 to 1947.

## REMARKS

The weather for September continued fair, warm and dry. The 1.91 inches of precipitation was the least since 1940 , and more than half was recorded by the storm of the 9 th. While measurable rainfall occurred on if days, only 3 days are recorded as cloudy, the remainder being fair or clear. The mean temperature for the
 normal heating load accumulated in the month. The highest temperature, 91 degrees on the 11 th, is the maximum for the month recorded .) times in the past 10 years. The lowest temperature, 34 degrees on the 1 ith, did not produce frost at the station, although higher elevations to the east received their first frost of the season, killing most gardens and susceptible field crops. There were no high winds during the month.
W. H. Thies, Extension Professor of Horticulture, contributes the following report: "A relatively warm, dry September has shown some interesting effects on farm and garden crops. In Amherst, the official low temperature for the month was 34 degrees, and even in lower areas frost damage was light. This made it possible to harvest undamaged tomatoes, green beans, grapes, etc., as late as October 1. Another feature of the September weather was its dryness, with less than half the normal rainfall during the month. This has given farmers a good opportunity to harvest corn, potatoes, fruit crops, and on some farms, a late cutting of alfalfa.

Apples have been rather slow in coloring although they have hung on the trees fairly well. In fact, a considerable percentage of the McIntosh crop was harrested during the last week in September. This is about a week later than in some seasons past. Apple growers will find it necessary to maintain high humidity in storage for at least two reasons. Boxes were very dry at harvest time which means that the wood will absorb water from the apples. Furthermore, there was more russetting of fruit this season and as a result more shriveling may be expected unless a relative humidity of at least $90 \%$ is maintained."

The third column gives extremes observed from 1889 to 1947.

## REMIVK

The weather for the month of Oetober was sery near the normal excepting the amount of precipitation. Of the $1.1:$ inches received. 0.t. inches was receired by the storm of the sth and the drouth condition beginming in Jity has not been aderpately relieved. Since the storm of July $1: 3$ only 6.96 inches of water has been receired and only $: 3$ stoms recorded precipitation in excess of $0 . i$ inches. Since the normal precipitation July through Octoher is $1 . i=1$ inches, there is a reason that streams and wells are observed to be very low.
IV. II. Thies. Extension Proicsior oi forticulture, contributes the following report: "ln seneral, (october weather was vers farorable for farm work. There was little more than an inch of ramfall in Western Xassachotsetts and the mean temperature was slightly above nomal. On one wecasion the temperature dropped to $21^{\circ}$ cansing some worry among aplle wrowers with fruit still on the trees. If few farmers experienced a water shortage. If the soil becomes thoroughly wet before it freezes, conifers will tend to suffer less drejng fronn winter winds.

Winter cover crops and new sedengs look musually well. Aside from the relatively mild weather this may be duc, according to Dr. W. G. Colby of the tgronomy Department, to the fact that there has been so little rain to leach the mitrates from the soil. Consequently, cover crops have had a better supply of mitrogen and are therefore making better grow than would have been the case if heary rains had fallen during October."

## REMARKS

The weather for the month was both warmer and wetter than normal. Precipitation of 5.2 .2 inches did not exceed last year's 5.63 , (normal is 3.41 inches) but in both years November has ended periods of lower than normal precipitation. In both years the late summer and fall have shown very light rainfall producing fire hazards of considerable proportions in woodlands, causing dry wells and low streams, and making the growth of some fall-planted crops very slight until aided by favorable conditions in November.

The mean temperature for the month was 46.3 degrees compared to a normal mean of 38.9 degrees. This was the highest mean daily temperature this station has recorded for the month. The previous record of 44.1 degrees was recorded in 1931.

The heating load of 563 degree-days is the least for the month since records have been kept at this station. The cumnlative heating load for the season now stands at 1088 degree-days, which is 301 below normal for the end of the month.
W. H. Thies, Extension Professor of Horticulture, contributes the following report: "The mildest November in recent years has influenced growing things in several ways. With little or $n o$ frost in the soil, rainfall has penetrated very largely where it fell. This will tend to benefit plants on drier soils next spring. In the case of conifers, particularly, it will tend to prevent drying from winter winds. The possibilities as regards trunk injury in fruit trees when the weather turns cold will depend, in part, on the degree of maturity. Except where trees were stimulated to make late fall growth, little damage is anticipated.

Rye cover crops have made unusually good growth thus adding more organic matter to the soil, and fall seedings are off to a good start. Strawberry plants have developed well during the fall season and there has been little need for mulching since the lowest temperature in Amherst was $20^{\circ} \mathrm{F}$. on November 30. The mild fall weather, according to E. H. Wheeler, Extension Entomologist, has resulted in the laying of many aphis eggs, the adult insects having survived later than usual."

## REM.\RKS

The weather for the month of January was characterized by its mildness in comparison with the same month of last year. With a mean daily temperature of 31.8 degrees for the month this was the warmest January since 1933, but the maximum of 5 degrees was reached in 194i. The honseholder noticed the effect on his purchased fuel with a heating load of $10: 9$ degree-days for the month and a cumulative load of 3108 for the season. Normal for the month and season are 1265 and 381 i degree-days respectively, while a year ago these values stond at 14.99 degree-day's for the month and 393 for the seasom.

The fall of snow was slightly above normal, with total precipitatuon nearly an inch above nomal for the month. Following the fall on the 31st. the month ended with 10.5 inches of snow on the ground. Whate the ramiall at the end of the previons month had reliesed anxiety over short water supply for wells, the more than aroage precipitation and the snow blanket assured grod ground water supply for the remainder of the winter. These comhine! with less than hormal wind movement relieved vegetation of danger of dessication which couk have taken place had the relatively mild temperatures been accompanied by drought conditions.
IV. Il. Thies, Extension Professor of llorticulture, contributes the following report: "The effect on frnit huds of an maseasonably. mild winter is of interest to fruit growers and consumers alike. Recent warm weather has catned rome swelling of fruit buds although apples and pears have apparently developed less than peaches."

According w I. S. Bailer, "I'each iruit buds appear large for this time of year. This is not surprising since the winter rest period ended several weeks ago. The warm weather has also caused internal changes which make the buds more susceptible to winter injury. Should really cold weather come, however, there may still be little injury if the temperature drops slowly ; if it drops rapidly to several degrees below zero, severe injury may be expected.
"On February \& therewere practically no dead buds in the University peach orchard. If 10 to $15 C^{\circ} \mathrm{c}$ of the buds are alive on Washington's Birthday, the chances for a crop are excellent."

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938 . The third column gives extremes observed from 1889 to 1947.

## REMARKS

The weather for the month continued the mildness recorded ior the first month of the new year. With a mean daily temperature of 30.4 degrees, it was the warmest February since 1890 which recorded 32.6 degrees, and is approached only by February $193 \%$ which showed 30.0 degrees. Against a normal mean daily temperature of 23.8 and last year's 21.4 degrees the month showed a mildness that was appreciated. The house-holder had to supply fuel for only 958 degree-days of heating load against last year's 1264 and the normal 1165 degree-days. At the end of the month the cumulative load for the season stood at 4086 against last year's 3196 degree-days and the normal 4982, or only 82 per cent of normal.

The snow fall was nearly normal but the precipitation of $2.4 \%$ inches of water was 0.2 inches less than the mean for the month. Some amount of snow covered the ground until the 19 th, and from that date the ground was bare until the storm of the 28th. Following a trace of snow on the 5th, the morning of the 6th recorded the lowest temperature of the winter, -1 degree. Excepting the zero recorded the morning of the 12 th, the other cold mornings of the month were merely "frosty" and coupled with warm afternoons started the maple sugar season.
W. H. Thies, Extension Professor of Horticulture, contributes the following report: "One might think that an unseasonably mild winter would cause very early development in all kinds of vegetation. But, fortunately, plant life is not greatly influenced by above normal winter temperatures. The mean temperature during February was more than $6^{\circ}$ above normal and yet apple buds, although somewhat swollen, remain in a more or less dormant condition. If cool weather prevails during the next few weeks, McIntosh apple trees may still come into bloom around May 10 to 15, as usual.

Concerning the effect of recent weather on forest trees, A. D. Rhodes of the Forestry Department says, "The mild winter has to date been generally favorable for forest trees. Plentiful rainfall, which fell on soil relatively free of frost and therefore well able to absorb it, has restored any deficit in soil moisture that may have existed as an aftermath of last summer's drought. Winter killing of conifers resulting from excessive transpiration, which might have been anticipated, is not likely to occur. Growth this spring should begin fairly early and proceed rapidly unless the weather at that time is unseasonably cold. Cold spring weather may damage buds of some trees, especially those not well protected, which already have shown some response to the springlike conditions during February."

## REMARKS

Whike the weather for the month continued warmer than normal, the is degree maximm recorded on the ?6th was 10 degrees less than the record March temperature of 1929 . In nine other years of record, the mean daily temperature has exceeded the 38.2 degrees of the past month, but never before have the first three months of the rear combined greater-than-arerage mean daily temperatures to produce the mildness of the past season. The heating load for the month was 8:31 degree-days against a normal of 9.30 and last year's 930 . while the season's cummative load at the end of the month totaled 491 agumst a nommal of $893 ?$ and last year: 6128 degree-dars.

Except for light snow on the 18th, snow cover disappeared on the ith. Precipitation was very light at 1.6 ; inches total water in the more than normal 10.5 inches of snow fall. Measurable precipitation occurred on only five dars of the month even though cloudiness exceeded normal and hours of bright sumshine were less than normal.
W. H. Thies, Extension Professor of Horticulture, contributes the following report: 'In spite of the many balmy dats during the winter, vegetation is still no more than two weeks ahead of normal. A cold spell now and then, as for example, a low temperature of $\because{ }^{\circ}$ on March $\because 0$ have provided a necessary check on swelling buds and a reminder that spring is not "just around the corner." How mild the past winter has been is well illustrated by these comparisons: Janmary was the warmest since $193: 3$. February the warmest since $18: 00$, and March among the warmest since 1929.

March was a relatively dry month with slighty more than an incl of rainfall in Amherst. Soaking rains and melting snowfall on mfrozen ground in previous months, however, have left the soil well supplied with moisture. Cover crops have wintered well. Fruit buds have thus far suffered no appreciable damage. although growers are already on the alert in the knowledge that apple scab spores are maturing early. Numerous pear psylla adulthave been observed in some orchards and red mite of one or more species promises to be a problem.

# Meteorological Observations 

FOR

## JULY

## 1949

II. N. STAPLETON

## OBSERVATORY

Latitude, $42^{\circ} 23^{\prime} 31^{\prime \prime} \mathrm{N}$. Longitude, $72^{\circ} 31^{\prime} 48^{\prime \prime} \mathrm{W}$.
Height of barometer above ground, 36 ft . Above sea level, 253.5 ft . Height of wind instruments, 67 ft . Time used, E. S. T.

Requests for bulletins should be addressed to the AGRICULTURAL EXPERIMENT STATION AMHERST, MASS.

## REMARK

While the month produced no record highs for mildness it did couple a low heating load to the season's already low figere which was appreciated by the householder. At the mean midpoint of the heating season which fell on the 22nd. less than 3000 degree days had accumulated. Late season severe weather which rould follow can still bring the seasonal figure up, but will likely run less than average for the season.

Precipitation at an arcumulated 4.33 inches of water is somewhat above the mean of 3.61 inches for the month and will aid in replacing the ground water deficit which has been acrumulating over the past 18 months of below mean rainfall.
W. H. Thies, Extension Professor of Horticulture, contributes the following report "There has been little visible swelling of peach bods in the I niversity orchard thus far and the number of live buds at present gives promise of a good crop. There is reason to believe, however, that sub-zero temperatures after this date would cause more damage than in early winter. Nore than 800 hours of temperatures below 45 are required to bring peach trees nut of their winter rest period, and thens set the stage for a response to warmer weather. Areond 40 they go through their rest period most rapidly. Above $45^{\circ}$, and also at temperatures much below freezing, the process is slowed up. Berause of this situation, peach buds in Massachusetts have not responded as much to the mild January weather as one might suppose.

A few comments concerning other fruits may alse be of interest. Apple and pear buds are still apparently in a strictly dommant stage. It is doubtful if any bud injury has occurred. An occasional case of bark splitting on the trimk may be traced to late stimulation and retard maturity. All raspberry varieties are probably out of their winter rest period, and there has been some evidence of tip-killing on canes of tender varieties, such as Washington. Strawberry plants, if protected by a layer of suitable mulch material, and in good condition. The absence of a snow cover during most of the winter season, has left ummulehed plantings exposed to rather wide extremes of temperature. This condition may be reflected in damaged plants and a smaller crop of berries next June."

## REMARKS

With the exception of the 8th the mild weather of the previous month continued until the 20th when a precipitous drop in temperature occurred which carried through to the end of the month. This greatest daily wind movement during the month combined with this temperature change provided the most uncomfortable winter conditions to that point of the season. The low of -8 degrees on the morning of the 21st however only approximated the - 7.1 mean lowest temperature for the month, and the mildness earlier provided a mean of 24.5 degrees against an average mean of 23.7 . The heating load continued very moderate at 1132 degree-days for the month to accumulate 4383 degree days for the season. The lengthening days with fair to clear cloud conditions helped offset the cold air masses and heary nocturnal radiation on clear nights.

The precipitation of 23.8 inches of snow which yielded 3.99 inches of water provided a margin above the mean of 3.19 inches for the month which will eventually be available to the ground water supply.

William G. Colby, Profesior of Agronomy, contributes the following report: "The relatively mild temperatures during the first 19 days of the month, coupled with somewhat more than average rainfall, helped tremendously in replenishing badly depleted soil moisture reserves. The last 10 days of the month were colder than normal but the ground was covered with a heavy blanket of snow, therefore preventing deep penetration of frosts into the soil."
"This means that soil moisture reserves will be still further replenished when the present snow cover melts. Field crop conditions to this point in the season continue favorable. A similar condition prevailed last year. Our summer drought would have been more serious had it not been for the absorption by the soil water produced from a comparatively heary, late winter fall of snow."

## REMARKS

The month was the coldest March since 1941 and continued the cold weather ushered in by the abrupt change which occurred February 20 . The maximum of $65^{\circ}$ was only a moderate highest temperature for the month, while the low of $-9^{\circ}$ was well below the mean of +6.1 . The heating load of 108.5 degree days was also the highest since the same month of 1941 , while the cumulative total of 5468 remained below the normal expected at the month's end.

High winds occurred on three days of the month with a maximum velocity of 40 mph . Total wind movement however, at 5683 , was below the mean of 5764 . Precipitation at only $2.67^{\prime \prime}$ was more than an inch below the mean for the month and.may be expecied to have its effeet on seasonal defieiency shown more fully after crops are planted. Thunder and lightning was recorded on both the 8 th and the 28th, the two milder days near each end of the month.
W. H. Thies, Extension Professor of Horticulture, contributes the following report: "A survey of Massachusetts peach orchards rereals severe damage from cold weather. All of the peach buds in some orchards have apparently been destroyed while a scattering of uninjured luds is found in a fow varieties. In a Woreesare County erchard examined April 5, about $10 \%$ of the buds on one odd variety were alive. Buds of other varieties showed brown centers. Several growers have reported enough live buds bere and there to suggest a very light arop this season.

In the ITniversity orchard, J. S. Bailey reports no live buds at all on Elberta, Halehaven, Golden Jubilee and many other varieties. A fow live buds were observed on the Greensboro variety.

The present peach situation is not surprising in tiow of the wide variation in winter temperatures, and the fact that we are near the northern limit of the peach belt. Peaches are among the ranst tender of the fruits grown in this area. But if peach growers see able to harvest a good crep three years ont of four under our chinatic conditions the gamble in setting a pearh orehard is justifiable provided a better than average soil and site are selected."

## Rに入1~KS

This month prosed a little reluetant to usher in the spring season. After a high for the monih of $\overline{7} 4^{\prime \prime}$ on the th it was a full 1 wo weeks before any 70 temperature agan appeared. The low of $22^{\circ}$ on the first reached the mean lowest temperature for the month and the mean daily of 43.8 was nearty two degrees below the average. Honseholders continned to feel the dregs of winter as 637 degree days of heating load acermulated the seasonal total of 6105 degree days.

The 3.64 inches of precipitation added nearly 03 inch over the mean to the moisture reserve fer the coming growing season.
II. H. Thies, Extension Professor of Horticulture, contributes the following report: "Cobl wather during April. with its retarding ellect $^{\text {a }}$ on fruit buds, has been farorable to fruit crops in Massachusetts. This applies to fruits of all kinds. The situation may be summed up as follows: The stage of bud development is ateme 10 days behind that of eertain seasons in the reernt past. Nelntosh apple buds, now in the Pre-Pink stage in stome areas, are better able to withstand freezing temperature that if they were approaching full blow. At these two stages there is a difference of at least 3 or 4 in susceptibility to frost damage. This mey mean a bye difierener in the number of blossoms setting fruit. Melntesh recond in Amberst show full blow occurring, on the a erese, around Xay 15, with a range of nearly 10 days in either direction. Vay 20 is the estimated date of full bloom this year.

As this is being written, there has been negligible low temperature damane to apple buds, and the stage is set fer at least a normal crop. Pearh buds sulfered severely during the winter in some orehards. This must be expected oreasionally since we are near the northern limit of the prach belt, and peeches are among the most tender of the fruits grown in this area. In well located orehards, however, there were still mough live peach buds of certain varieties on Vay 1 to provide at least alight crop.
stazherry plants in muldhed plantings came through the winter in grod eondition. Bloom is likely to be delayed enough to escape apprediable frost damage. Ewen though a few of the carly blossoms do show black centers, it will mean only the lose of the carlicst berries and not any extensive reduction in the number of 'quarts per aree."

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1949.

## REMARKS

The month was quite normal with regard to temperature and other conditions except precipitation. The mean figures over the period of observation indicate a 4.10 inches precipitation expected for the month with but 2.83 inches recorded; of which 1.23 inches fell on the 18th. While this storm was appreciated. it did not offset the development of drouthy conditions which slowed the growth of tobacco and made it unnecessary to mow lawns which were not sprinkled.

Even though a mean daily temperature of 59.5 degrees was recorded on the 20th, no heating load is considered in this locality to accumulate during July and August under conditions which are near the mean values.

## REMARKS

The weather for the month was quite comfortable with the highest temperature, 88 degrees, reached on the 9 th. The mean daily of 66.8 degrees, however, was accompanied by the mean relative humidity of $75.5 \%$ so that rather stuffy weather would have been experienced with much increase in temperature.

Only 2.94 inches of rain of the mean expected 4.08 inches was recorded and 1.15 inches of the total fell on the 19th. This broke the drouthy period to which farmers were giving serious consideration. The total wind movement of only 2268 miles against a mean of 3127 miles indicates that even normal wind could have made the effect of the drouth much more serious. Cloudiness above the mean value also undoubtedly contributed to making the drouthy conditions more hearable.

The third column gives extremes observed from 1889 to 1949. |  |  |
|  |  |  |

## REMARKS

With the last half of the month registering very cool temperatures, the mean for the month ran mearly three degrees below the average of 61.7 degrees. The low temperatures accompanied by less than average wind movement made the dreuth more bearable. Of the 2.34 imehes of precipitation recorded, 0.93 came in one storm en the first day of the month which spread the remainder very thin in a month, with an expected average 4.24 inches total rainfall.

Heating load for the month was 209 degree days, slightly over the average figure but hardly a measure of the seasonal load to be anticipated.

The first frost of the season occurred the night of the 24-25th

The third column gives extremes observed from 1889 to 1949.

## SIMMARY

The outstanding feature of the weather during the month was the high wind and rainfall which came on the 25th. The daily movement of wind was 550 miles, which is the highest that has occurred since Fedbruary 15, 1940. The recorded velocity of 48 miles per hour was a record for the month of November. A tetal of 2.28 inches of rainfall came with the wind storm.

A new record for air temperature in November occurred on November 2 when the air temperature was at $\$ 2^{\circ} \mathrm{F}$. In general, warm weather prevailed throughout the month giving a mean daily of $42.8^{\circ} \mathrm{F}$. as compared to a normal of $38.9 \mathrm{~F}^{\circ}$. The degree days of 667 was below the normal of 783 .

The rain which came with the storm on the 25 th resulted in a total precipitation for the month of 6.60 inches, which was considerably above the normal of 3.41 . The total precipitation to the end of November was 37.23 inches which is some what below the normal of 40.31 inches.

The mean relative hmidity of 82.5 per cent was far abone the normal of 70.6 .

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938 , except that humidity records are based on ohservations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1550.

## SIMMAR)

The mean dally temperatures the forepart of January were above normal. This, together with above normal mean daily temperatures during November and December, resulted in an accumulated degree days of 3,013 to January 22, which is the mean mid-point of the heating season. This is about 10 per cent below the normal of 3,352 . The mean daily for the month of $27.4^{\circ} \mathrm{F}$. was more than $3^{\circ} \mathrm{F}$. above the normal of $24.2^{\circ} \mathrm{F}$.

The precipitation during the month of 3.28 inches was below the normal of 3.61 inches.

A mean relative humidity of 79.5 per cent was considerably above the normal of 70.1 per cent and added to the rentilation problems in poultry houses and dairy barns.

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity 1 ecords are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1950.

## REMARKS

The weather for the month was generally warm except for a cold period on the 8th, 9th, and 10th. The last 11 days of the month were above 30 degrees mean daily and 8 of the 11 were above 35 degrees mean daily. The mean daily for the month was 29.6 degrees. The warm weather during the month gave a total of 990 degree days for the month, as compared to a normal of 1166.7. The cumulative degree days to the end of the month was 4428 which is only slightly above that of 1950 which was 4383. Only 6 inches of snow fell during the month, as compared to a normal of 13.99 , but precipitation for the month was 4.61 inches, as compared to a normal of 3.19. Considerable cloudiness occurred throughout the month and the hours of bright sunshine were 99 which was far below the normal of 158 . The mean relative humidity of 79 per cent was also far above the normal of 66.6 .

Note-The first column in the above summary gives observations made during the month.
The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1950.

## REMARKS

The mean daily temperature for the month of April was 48.4 degrees as compared to a normal of 45.7 degrees. There were 500 degree days for the month and the normal is 579 . The cumulative degree days for the season of 5821 is far below the normal of 6455.

The precipitation for the month was about normal with a total of 3.63 inches. The normal for the month is 3.35 inches. No snow fell during the month, while normally a snowfall of 2.71 inches would occur.

As with previous months, the mean relative humidity continued far above normal. The reading was 72.6 per cent as compared to a normal of 61.6 per cent. Considerable cloudy and foggy weather occurred during the month. The hours of bright sunshine were only 169.7 as compared to a normal of 220 . Foggy weather occurred nine days during the month when the reading was taken at 8 a.m.

## R E M A R K S

The degree days for the month of May were slightly below normal, the reading being 211 as compared to a normal of 245 . This brought the cumulative degree days for the season to a total of 6,032 , as compared to a normal of 6.700 . This was somewhat higher than the mild winter of 1948-1949 and is slightly below the cumulative degree days for the winter of 1949-1950. The cumulative degree days for the season to the end of May 1949 were 5,551 and the cumulative degree days for the heating season to the end of May 1950 were 6,335 .

In general the weather during the month was mild and dry. The last frost for the month occurred on May 14. The precipitation was below normal with a reading of 2.96 inches as compared to a normal of 3.60 inches. Following the rainfall of .14 inches on April 25 no appreciable amount of rain fell until May 11. A total of 1.19 inches fell on May 11 and 12. There was very little rainfall following this until May 24 and 27 when a total of 1.50 inches was recorded.

Although the rainfall was below normal, the relative humidity continued to be far above normal as it had in preceding months. The mean relative humidity for the month was 72.2 per cent as compared to a normal of 60.7 per cent. The number of hours of bright sunshine of 211.5 was low as compared to the normal of 252 hours.

## REMARKS

The dry period, which began May 28, extended until June 13 before any rainfall occurred. Following this period of drought rainfall occurred on nine of the eighteen remaining days in June. Total precipitation for the month was 3.04 inches as compared to a normal of 3.75 inches.

Cloudy weather prevailed throughout the month. Bright sunshine occurred only 39 per cent of the possible hours. The normal for the month is 54 per cent. As with preceding months, the relative humidity continued high. The mean for the month was 77.2 per cent as compared to a normal of 66 . 9 per cent.

## R E M A R K S

The July weather was near normal in nearly all respects. No extremes were recorded but the high mean relative humidity of previous months was continued as was also the more than normal amount of cloudiness. The mean relative humidity of 77.1 was considerably above the normal of 68.4. The mean cloudiness at 60.3 per cent was also above the normal of 50.9 The per cent of possible hours of bright sunshine recorded at 51.1 was below the normal of 58.

The readings for air temperature and rainfall were close to normal. The rainfall was slightly above normal for the month. It has been above normal for every month except June during 1951. This has resulted in an accumulated precipitation of 26.8 inches to the end of July as compared to a normal of 25.3.

## REMARKS

The month of August was near normal in most respects. The mean daily temperature was 68.4 while the normal for this month is 68.6 . The highest for the month was 90.0 as compared to a normal of 91.6 .

The precipitation during the month was 3.56 inches which compares to a normal 4.08. Of the total amount during the month 1.98 inches fell on the 16 th and 17 th. There were eleven days during the month when a total of 0.01 of an inch or more fell. This is equal to the number of days during the month on which we can expect 0.01 of an inch or more of rain. While the precipitation during the month was below normal, the accummated precipitation for the year is still approximately one inch above the nomal.

The mean relative humidity for the month was 82.3 which compares to a normal of 70.2 for the month. The mean relative humidity has beon running far abow nommal and this is still the case during the month of August. In spite of the high mean relative humidity the cloudiness and hours of bright sunshine for the month were about normal.

The total wind movement for the month was 2133 miles which compares to a normal of 3127 . There were no wind storms during the month and the maximum velocity was 32 miles per hour which was reached on the 16th.

Note--The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations mathe from 1929 to 1938. The third column gives extremes observed from 1889 to 1950.

## REMARKS

The weather for the month of September was mild and dry. The mean daily temperatures for the month averaged 61.4, only 0.3 degrees below the normal mean daily temperature of September. Although the low precipitation of 2.63 inches was considerably under the 4.24 inch average for the month, higher than normal relative humidity helped offset the effect of the light rainfall. Nearly 40 percent of the month's rainfall was accounted for by the storm of the 15 th.

Heating load for the month was 147 degree-days, slightly more than normal, but one-sixth of the total came on the 30th, accompanying the first frost of the season.

While the first frost of the season occurred on the 30th, 9 days later than normal, it may be noted that the records show no first frost to have occurred on the average date, the 21st, in this century.

## REMARKS

In general, pleasant weather prevailed throughout the month of October, providing an opportunity for the observance of brilliant foliage brought out by the frost during the last week of September. Although the precipitation was above normal with a recording of 4.66 compared to a normal of 3.29 , the mean cloudiness was far below normal with a recording of 35.5 percent compared to a normal of 48 percent. The percent of possible hours of bright sunshine was also somerthat above normal with a reading of 56.1 percent compared to a normal of 51.3 percent.

The mean daily temperature was above normal with a reading of 54.8 compared to a normal of 50.5 . The mean relative humidity continued to be considerably above normal. The figure for the month of October was 74.8 percent compared to a normal of 69.0 percent. The mean relative humidity has been above normal every month for over a year. In some months this figure has been as high as 12 percent above normal. The relative humidity of 74.8 for the month of October is closer to the normal than the relative humidity in most of the months during the previous year.

## R E M A R K S

The mean daily air temperature during the month of November was slightly below normal, and the rainfall for the month was far above normal. The lowest temperature recorded during the month was 8 ; this was recorded on November 28. The highest temperature was 66 , and the mean daily temperature during the month was 37.2 . The normal mean daily temperature for the month is 38.9 .

As a result of the low mean daily temperature for the month, the number of degree-days of heating load for the month was slightly above normal. The reading for this was 835 compared to a normal of 783. The accumulative degree-days for the season stand at 1310.5 which is very close to normal.

The total precipitation for the month was 6.39 inches. This is far above the normal rainfall of 3.41 inches for the month. The first snowfall occurred on November 3, and the total snowfall for the month was 3 inches. The maximum precipitation in 24 hours during the month occurred on the 3rd when 2.04 inches of rainfall was recorded. On nine days of the month the rainfall exceeded .01 inches. The wind movement during the month was not excessive, the highest velocities being recorded on the 8 th and 26 th; the velocity reached 32 miles per hour.

The mean relative humidity for the month continued far above normal with a reading of 77.9 compared to a normal of 70.6. This tendency has continued for over a year. The mean cloudiness for the month was slightly below normal, and the percent of possible hours of bright sunshine was slightly above normal.

| Percent of possible hours of <br> bright sumshine $\qquad$ | 40.7 |  |

Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes (dserved from 1889 to 1951.

## KEMARKS

The mean daily temperature during the month of January was considerably above the normal, the reading being 28.8 degrees, as compared to a nomal of 24.2 degrees. This resulted in a reduction in the degree days so that up) to the middle of the heating season on January 22 the degree days accumulated were $318+.5$, as compared to a normal of 3352 .

The precipitation during the month was 4.02 inches: there was also 1א.2 inches of sumfall. The normal of these two for the month is 3.61 and 13.32 inches, respectively. This excess of precipitation over the normal has continued for some time. During the month there were $1+$ dass which had a daily total precipitation of 0.01 inches or more.

The wind movement during the montlo was considerably below normal. The total movement was. $377+$ miles as compared to a normal of 5055 miles. However, the winds during the month were not entirely low in velocity, as a recording of $t 0$ miles per hour was taken on January 18th.

The mean relative humidity for the month was 82.7 per cent, as compared to a nomal of 70.1 per cent. This is in line with readings which for over a year have continued to be 10 points above normal.

## REMARKS

The mean daily temperature during the month of February was 5.5 degrees above normal. The reading was 29.2 as compared to a normal of 23.7. The degree days for the month were 1037.5 as compared to a normal of 1167. The accumulative degree days for the season at the end of February were 4579.5 as compared to a normal of 4927. The accumulative degree days are slightly above 1950 and also above 1951, but the heating load has still been considerably below normal.

The precipitation for the month was 1.97 inches, which is far below the normal of 3.19 inches. This is the first month for several months that the precipitation has been below normal. The snowfall to the end of February was 42.6 inches, which is 14.45 inches above normal, but warm weather and a certain amount of rainfall have reduced the amount of snow on the ground so that at present there appears to be little danger of flood in the Connecticut Valley from an accumulation of snow: This statement, of course, must be qualified, according to the conditions that prevail in the Connecticut Valley above Amherst. The excess moisture in the soil which has accumulated over a period of several months because of the more than normal rainfall could result in a flood if sudden and heavy rainfall should occur. The soil has little ability, in its present condition, to absorb further moisture.

The mean relative humidity was far above normal for the month, as it has been for many previous months. The mean relative humidity for the month was 81.0 as compared to a normal of 66.6 .

Note-The first column in the above summary lists observations made during the month. The second column lists the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1951.

## REMARKS

The mean daily temperature during the month of March was only slightly above normal with a reading of 35.3 compared to a normal of 34.4. The degree days of 919.5 for the month brought the accumulative degree days for the season to the end of March to a total of 5499 . The normal for this period is 5876 .

The precipitation for the month was 3.17 compared to a normal of 3.70. Even though this amount of rainfall was below normal, a slight increase in rainfall in the Connecticut Valley conld have resulted in a flood inasmuch as the river was close to flood stage. The snowfall during the month was 7.4 inches compared to a normal of 7.47 inches. The total snowfall for the season to the end of March was 50.0 inches.

The mean relative humidity continued to be far above normal with a recording of 79.0 as compared to a normal of 64.2 . The number of hours of bright sumshine, which may have an effect upon the 1952 crops, was considerably above normal with a recording of 61.2 compared to a normal of 53.6 . This is far in excess of the recording in March of 1951 when a reading of 32.2 was recorded.

## DAILY RECORDS

*Based on least time required to blow one mile.

MONTHLY SUMMARY

Note-The first columm in the above summary lists observations made during the month. The second column lists the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column gives extremes observed from 1889 to 1951.

## REMARKS

The mean daily temperature for the month of April was well above normal with a reading of 50.8 as compared to a normal of 45.7. This resulted in less degree days of heating load for the month than is normal. The reading for this was 433 as compared to a normal of 579 . The accumulative degree days for the season were 5932 as compared to a normal of 6455 .

The precipitation for the month was 3.40 as compared to a normal of 3.35. A great increase in this normal amount of rainfall could have had serious consequences in the Comecticut Valley because the river was nearly at flood stage for the greater part of the month.

The mean relative humidity was much lower than for the month of March but it was still considerably above normal for the month of April. The reading was 72.6 as compared to a normal of 61.6 . The increase in the percentage of possible hours of bright sunshine begun in March continued through April. This reading was 59.4 as compared to a normal of 54.7.

## REMARKS

The weather during the month of May was unusual because the mean daily temperature was slightly below normal; the mean daily temperature was 56.1 compared to a normal of 57.1 . This resulted in having the degree days for the month above normal. This reading was 280.5 and brought the accumulative degree days for the season to 6212.5 .

Rainfall occurred chiefly on weekends. The total rainfall for the month was 4.00 inches as compared to a normal of 3.60 inches.

The mean relative humidity continued to be far above normal with a reading of 74.0 as compared to a normal of 60.7 . The mean cloudiness was near normal, and the percent of possible hours of sunshine with the reading of 51.1 was slightly below the normal of 55.6.

Note-The first column in the above summary lists observations made during the month. The second colum lists the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column lists extremes observed from 1889 to 1951.

## REMARKS

Total precipitation for the month was 4.97 inches of which 2.70 inches occurred on the first day. The storm starting May 31 accumutated 2.76 inches of rain in less than 12 hours.

Good weather prevailed throughout most of the month with only four cloudy days. Bright sunshine occurred 58.1 percent of the possible hours, the normal for the month being 54 percent.

As in the preceding month, the mean relative humidity remained high. A high temperature of $98^{\circ}$ occurred on the 26th with a mean of $84.5^{\circ}$ for the day.

The total wind movement was high with 3834 miles of total movement compared to a normal of 3,585 .

## いEATHER SUMMARY

The highest temperature for the month was $95^{\circ}$ which occurred on the $1+$ th and 23 rd , and the lowest was $50^{\circ} \mathrm{F}$. on the first. The mean temperature was $75^{\circ}$, the normal for the month being $70.8^{\circ}$. The highest mean daily temperature was $82.5^{\circ} \mathrm{F}$., and the lowest mean daily $65.5^{\circ} \mathrm{F}$. The greatest daily temperature was $37^{\circ} \mathrm{F}$. on the 2 Gth, and the least daily range was $3^{\circ} \mathrm{F}$. on the tenth.

The rainfall was slightly above normal for the month with 4.99 inches of precipitation, the normal for the month being 4.10 inches. Of the 4.99 inches of rainfall for the month, 2.01 inches fell in an eleven-hour period on the 10th.

A wind velocity of 32 MPH occurred on the 10th, and the total wind movement for the month was 2919 miles. The mean relative humidity of 72 was above the normal of 68.4. The per cent of possible hours of bright sunshine recorded 61.3 was above the nomal of 58 . The number of clear days for the month was 16 , the nomal being 10. Five thunder and lightning storms occurred during the month.

## REMARKS

The weather for August was normal. The mean temperature was $68.95^{\circ}$ with a precipitation of 3.98 inches. Although the weather conditions were normal for the month, the serious summer drought experienced by eastern and southern states carried into the early part of August and was ended by heavy rains, wind storms, and hail between the 10 th and the 17 th of the month. The storms were localized and did a great deal of damage to the farm crops and buildings in the areas affected.

Note - The first column in the above summary lists observation : made during the month. The second column lists the averages based on observations made from 1859 to 1938, except that humidity 1 ecords are based on observations made from 192\% to 193\%. The third column lists extremes observed from 1899 to 1951.

## R E M A R K S

The mean daily temperature for the month of September was 1.5 degrees above normal and the mean relative humidity 8.6 percent above normal. The number of hours of bright sunshine was 84 compared to a normal of 201 . All these factors made the month of September seem unusually warm and in many cases uncomfortable. There was no frost during the month of September.

[^114] The second column lists the averages based on observations made from 1889 to 1938 , except that humidity secords are based on observations made from 1929 to 1938. The third column lists extremes observed from 1889 to 1951.

## REMARKS

The outstanding feature of the October weather was the small amount of rainfall, all of which oecurred in the first seven days of the month.

The lack of rainfall ereated bery dry woodland conditions. resulting in many forest fires.

The first general frost occurred on October 11. Temperatures for the month were normal; the number of degree days for the month was 446 , and the total accumulative degree days for the heating season was 557.

## R E M A R K S

The mean daily air temperature during the month of November was above normal; the degree days for the month were 737 compared to the normal of 783 .

Precipitation for the month was 0.89 inches compared to the normal of 3.41 inches.

The mean relative humidity for the month was 77.0 per cent, mean cloudiness 56.7 per cent; there were 108.2 hours of bright sunshine during November.

＊Based on least time required to blow one mile．
Hans Joa，Observer

Note - The first column in the above summary lists observations made during the month. The second column lists the averages based on obscrvations made from 1889 to 1938, except that humidity secords are based on observations made from 1929 to 1938. The third column lists extremes observed from 1889 to 1952.

## REMARKS

The weather during the month of January was exceptionally mild. This abnormal weather is reflected in the mean daily temperature, which is 6.2 degrees above normal, and the degree days for the month which are 1071, compared to a normal ot 1265.

The precipitation for January was 6.24 inches, compared to the normal of 3.61 inches.

The mean relative humidity was 81.6 percent, mean cloudiness 59.2 percent. Snowfall and snow accumulation were both below normal.

## REMARKS

The mean daily temperature for the month of February was 7.8 degrees ( F ) above normal. This is the highest February mean daily temperature since 1925. February is the fourth consecutive month having a mean daily temperature above normal.

The degree days accumulative for the 1952-53 heating season are 4300.5 compared to a normal of 4927 . The mild winter is reflected in the low number of degree days.

## REMARKS

The mean daily temperature during March was $3.3^{\circ} \mathrm{F}$. above normal. This is the fifth consecutive month that the mean temperature has been above normal. The cumulative degree days for the hrating season through March is 5132 degree days compared to the normal of 5876.

The rainfall during March was 8.28 inches; this is 4.58 inches above normal and is the most rainfall recorded in March since the start of our records in 1889. The rainfall occurred on 15 davs: the maximum in 24 hours was 1.77 inches. The rainfall during March was the most for any month since the September 1938 hurricane. Dr. Ives of Amberst College points out that water aceumulation since January $l$ is about 70 percent above normal.

Dr. Frank Southwick of the Pomology Department makes the following remarks:
"Wild temperatures were experienced during January, February, and March. Fruit plants appear to have come through the winter with virtually no signs of winter injury. In Mclntosh apple blocks where the crop was light in 1952. it can now be seen that a very heavy hoom is going to occur. Pearhes apparently will bloom heavily, also. At the end of March, apple flower buds had commenced to swell but were still in suitable condition for a dormant spray application. The almost continuous rain period during the latter part of Mareh made spraying and crop planting diffeult or impossible. however."

## REMARKS

The mean daily temperature during April was 1.9 degrees ahove normal. The precipitation was 5.36 inches. 2.01 inches above normal; the precipitation since January 1 wa- 22.85 inches.

Dr. Frank Snuthwick of the Pomology Department made the following ohservations:
"Athough April averaged 1.9 degrees above normal, bud development of fruit plants at the end of the month was about average. Apparently the maximum daily temperatures were sufficiently low to impede growth even though the average mean temperatures were above normal. McIntosh apples reached delayed dormant about April 10. They remained dormant about two werks and were not in a full pink stare at the end of the month.
"About April 2.5, plums, cherries, and peaches commenced to bloom, but are not expected to reach full bloom until early May. Since the blossom period will probably occur about the usual time, the chances of loss of fruit from spring frosts do not appear to be great. Excessive rainfall in April has made scat, control a difficult problem for apple growers and has delaye 1 the planting of annual crops."

Note - The first column in the above summary lists observations made during the month. The second column lists the averages based on observations made from 1889 to 1938 , except that humidity records are based on observations made from 1929 to 1938. The third column lists extremes observed from 1889 to 1952.

## REMARKS

The mean daily temperature for the month of May was 2.6 degrees above normal. The rainfall for the month was 6.76 inches compared to the normal of 3.60 inches.

Dr. Frank Southwick of the Pomology Department makes the following remarks:
"May was another very wet month with total rainfall about double the average amount. Temperatures for the month were near the seasonal average so that fruit plants generally blossomed at about the expected time. Peaches were in full bloom about May, and apples were in the pink stage of development on the same date. All apple varieties blossomed from May 9 to 13. Weather conditions during the apple blossoming period were excellent for pollination and fertilization. A good set of all fruits is anticipated. No killing frosts were experienced in the fruit-producing areas of the State during May."

## REMARKS

The mean daily temperature for the month of June was 69.1 degrees. This is 3.4 degrees above normal. The precipitation for the month was 2.41 inches compared to the normal of 3.75 inches. During the period May 28 to June 2] there was only 0.11 inch of rainfall. thereby creating mild drought conditions.

Dr. Frank Southwick of the Pomology Department makes the following remarks:
*The month of June was below normal in rainfall but above average in sunlight and average mean temperature. Dry weather noticeably influenced the size and yield of unirrigated strawberries. It does not appear that dry weather has influenced growth of tree fruits yet. Now that the June drop is over, it is apparent that most apple varieties which hloomed, with the possible exception of Delicious, have set enough fruit for a full crop. The above normal amount of sunlight is expected to favor flower hud formation for the 1954 apple crop and help return many alternating McIntosh blocks to an annual bearing condition. As one might expect, following the excessively wet months of March, April, and May, apple scab is a serious problem in many orchards. Peaches have set very heavily. and an above average crop of this fruit is anticipated."

## REMARKS

The small amount of rainfall, 1.95 inches, compared to the normal of 4.10 inches. was the outstanding feature of the July weather. The mean daily temperature and the mean relative humidity were both sery near normal.

The temperature was in the "90's" for four consecutive days, July 16. 17. 18. and 19. Accorting to Professor Kightlinger of the Department of Agronomy this hot spell caused consilerable damage to tobacco.

## REMARKS

The weather for the month of August was unusual. The early part of the month was rool with the last week in the month reaching record highs. The mean daily temperature for the month was 1.2 flegrees above normal. Atthough the record high temperalure for August was not broken. record high temperatures were reforded for tugust 29. 30 and 31.

The rainfall for the month was 1.87 inches compared to the normal of 4.08 inches.

Dr. Ives of South Amherst reported that August was the tenth consecutive month with above normal temperatures. He also ohserverl that this was the fifth driest summer (least rain) since 1929.

Note - The first column in the above summary lists observations made during the month. The second column lists the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column lists extremes observed from 1889 to 1952.

## REMARKS

The outstanding feature of the September weather was the low rainfall. The precipitation was 1.88 inches compared to the normal of 4.24 inches.

A new record temperature for the month was established SeptemLer 2 when the mercury reached 99 degrees.

Note - The first column in the above summary lists observations made during the month.
The second column lists the averages based on observations made from 1889 to 1938, except that humidity records are based on observations made from 1929 to 1938. The third column lists extremes observed from 1889 to 1952.

## REMARKS

The outstanding feature of the October weather was the rainfall of 5.15 inches compared to the normal of 3.29 inches. This was the first month since May that the rainfall was ahove normal. Rainfall for the first 10 months of 1953 was 42.41 inches compared to the normal of 36.91 inches.

The mean daily temperature for October was 3.1 degrees above normal.

## NOVEMBER

## 1953

## I. J. PFLUG

## OBSERVATORY

Latitude, $42^{\circ} 23^{\prime} 31^{\prime \prime} \mathrm{N}$.
Longitude, $72^{\circ} 31^{\prime} 48^{\prime \prime} \mathrm{W}$.
Height of barometer above ground, 36 ft . Above sea level, 253.5 ft .
Height of wind instruments, 67 ft . Time used, E. S. T.

Requests for bulletins should be addressed to the AGRICULTURAL EXPERIMENT STATION AMHERST, MASS.

## DAILY RECORDS

* Based on least time required to blow one mile.

Hans Ioa, Olbserier

[^127]
## REMARKS

The mean daily temperature for Norember was 43.2 degrees compared to the normal of 38.9 degrees Fahrenheit. The rainfall for November was 2.36 inches compared to the normal of 3.41 inches.

The first snowfall of the season occurred on November 7 .

The third colmm gives extremes observed from 1889 to $194 t$

[^26]:    *Based on least time required to blow one mile.

[^27]:    "We cannot expect this unseasonably warm weather to continue. We usually get temperatures in April low enough to cause severe injury to vegetation when it is advanced as far as it is at the end of March. While a light frost would not now do great damage, temperatures in the low twenties would cause great injury. Last year the low temperatures in April brought about a situation indicating little danger from spring frosts. Warm weather of early May advanced vegetation very rapidly, apple trees blossomed a day or two earlier than the average, and a disastrous frost occurred on the morning of May 19. This year conditions are reversed and damaging spring frosts are probable. We can only hope that luck will change this year and that we may have cooler weather in April, slowing the progress of vegetation, but without minima low enough to cause injury."

[^28]:    Note-The first column in the above summary gives observations made during the month. The second column gives the averages based on observations made from 1889 to 1938 . except that humidity records are based on observations made from 1929 to 1938.
